

# SNS COLLEGE OF TECHNOLOGY

(An Autonomous Institution)

Approved by AICTE, New Delhi, Affiliated to Anna University,  
Chennai Accredited by NAAC-UGC with 'A++' Grade (Cycle III) &  
Accredited by NBA (B.E - CSE, EEE, ECE, Mech & B.Tech.IT)  
COIMBATORE-641 035, TAMIL NADU

## DEPARTMENT OF COMPUTER SCIENCE AND ENGINEERING

Course Code & Name : 23CST206-OPERATING SYSTEMS AND VIRTUALIZATION  
Class : II CSE  
Course Faculty : Ms.R.SWATHIRAMYA

### Question Bank

#### UNIT-III

#### 🧩 Puzzle 1: The Missing Pages

A process needs **10 pages**, but only **4 frames** are available. The page reference string is:

1, 2, 3, 4, 1, 2, 5, 1, 2, 3, 4, 5

Using **FIFO page replacement**, how many page faults occur?

#### 💡 Hint:

FIFO removes the oldest page first. Track frame changes step-by-step.

#### ✅ Answer:

**10 Page Faults**

#### 🧩 Puzzle 2: Fit Me If You Can

## MEMORY MANAGEMENT PUZZLE

### PUZZLE

A process has 4 pages:  
A, B, C, D, with 3 frames.  
The sequence is:  
A, B, C, A, B, D, A, C, B, D

?
?
?

### HINT

Using LRU Page Replacement

← LEAST recently used

### ANSWER

Total Page Faults:

**8**

A	B	C
A	X	← Evicts C
D	A	
C	B	

### 🧩 Puzzle 3: Fit Me If You Can

You have memory blocks of sizes:  
100KB, 500KB, 200KB, 300KB, 600KB

Processes arrive with sizes:  
212KB, 417KB, 112KB, 426KB

Using **First Fit**, where will each process be allocated?

#### 💡 Hint:

First Fit → Allocate the first block that is large enough.

#### ☑ Answer:

- 212KB → 500KB
- 417KB → 600KB
- 112KB → Remaining 288KB (from 500KB block)
- 426KB → Not allocated ✗

### 🧩 Puzzle 4: Paging Puzzle

**File Allocation Mystery**

A file is stored using linked allocation with blocks:  
5 → 9 → 13 → 20

*If block 9 is corrupted, what happens?*

**Hint:** Linked allocation depends on pointers.

**Answer:** Blocks after 9 become inaccessible! Because the chain is broken.

ERROR! LINK LOST

13?? → 20

The graphic illustrates a linked list of blocks (5, 9, 13, 20). Block 9 is corrupted, breaking the chain. A magnifying glass highlights the 'LINK LOST' error, and a broken chain is shown below.

### 🧩 Puzzle 5: Paging Puzzle

A system has:

- Logical address space = **16 pages**
- Page size = **1 KB**

What is the size of the logical address (in bits)?

#### 💡 Hint:

Logical address = Page number bits + Offset bits

Offset =  $\log_2(\text{page size})$

#### ☑ Answer:

- Page size = 1KB = 1024 bytes → **10 bits offset**
- Pages = 16 → **4 bits page number**
- ☞ Total = **14 bits**

### 🧩 Puzzle 6

## SCAN Disk Puzzle

### QUESTION

Disk Requests: 40, 180, 10, 150, 90

Initial Head = 50

Moving towards 0

Which request is served first in SCAN algorithm?

### HINT

SCAN moves in one direction first (like an elevator). It services all requests in its path to the end before reversing.

### ANSWER

Moving towards 0 → nearest request in that direction is 40

✓ SO, FIRST SERVED = 40

### 🧩 Puzzle 7: Thrashing Trouble

A system is experiencing heavy **thrashing**. CPU utilization is very low, and page faults are very high.

What is the **main reason**?

💡 **Hint:**

Think about memory allocation vs process demand.

☑ **Answer:**

☞ **Insufficient frames allocated to processes, causing frequent page faults and excessive swapping.**

### 🧩 Puzzle 8:

## Segmentation Trap

A process has 9 segments:

- Segment 0 → Base = 1000, Limit = 400
- Segment 1 → Base = 2000, Limit = 300
- Segment 2 → Base = 3000, Limit = 500

Is this `1d` or invalid?

💡 **Hint:**

Check if offset < limit.

✓ **Answer:**

Segment 1 limit = 300

Offset = 350 ✗ exceeds limit

**Invalid address**  
(Segmentation Fault)

## 🧩 Puzzle 9: Disk Scheduling Mystery

Disk queue requests:

98, 183, 37, 122, 14, 124, 65, 67

Initial head position = 53

Using **SSTF (Shortest Seek Time First)**, what is the **first request served**?

💡 **Hint:**

Pick the closest track to current head position.

✅ **Answer:**

👉 Closest to 53 is **65**

So, **first request served = 65**

PUZZLE 10:

### Page Table Size Puzzle

#### QUESTION

A system has:

- Logical address space = 32 pages
- Page size = 2 KB
- Each page table entry = 4 bytes

Find the total size of the page table.

#### HINT

👉 Page Table Size = Number of pages × Size of one entry

10	4 bytes
31	4 bytes
32	4 bytes
⋮	⋮
32	4 bytes

$$= \begin{matrix} 4 \text{ bytes} \\ 4 \text{ bytes} \\ \vdots \\ 4 \text{ bytes} \end{matrix} \times \begin{matrix} 4 \text{ bytes} \\ 4 \text{ bytes} \\ \vdots \\ 4 \text{ bytes} \end{matrix}$$

#### ANSWER

- ✅ Pages = 32
- ✅ Entry size = 4 bytes

👉 TOTAL SIZE = 32 × 4 = 128 bytes

Result:  + × \* ÷
