Lines and Rays

Thursday

Vocabulary:

Line Segment – The shortest path connecting two points

Ray – A line segment with one endpoint and extends infinitely on other direction

Polygon – A closed shape formed from straight line segments

Vertices – The points where two sides (line segments) meets.

Know	Want	Learnt
2D and 3D shapes	Knowledge on polygons	Lines, Line Segments and Rays

Fill Up:

1. Sunrays is an example of a ray. (nature)
2. A line segment with both endpoints on the circle and passing through the centre of a circle is diameter.
3. A polygon with five sides is called Pentagon.
4. A rectangle has two pairs of opposite sides equal.
5. A polygon whose all sides are equal is a regular polygon.

Hots :

1. Is line \overleftrightarrow{AB} same as line \overleftrightarrow{BA} ? Why ?

Yes. The Line \overleftrightarrow{AB} and line \overleftrightarrow{BA} are same since the line extends on both the side there is no difference.

2. Is ray \overrightarrow{AB} same as ray \overrightarrow{BA} ? Why ?

No. The ray \overrightarrow{AB} and \overrightarrow{BA} are not same since the endpoints of them are different.
