

New Product Development

Unit 1

Product Development and Customer Needs

Topic: FAST METHOD

Text book

Kevin Otto and Kristin Wood ,” Techniques in Reverse Engineering and New Product Development”

Establishing product function

- A **function** is the relationship between the **available input** and the **desired output of a product**, independent of any particular form.
- **Product function** – overall intended function of the product. What it is to do.
- **Subfunction** – A subfunction is a component of a product function.
- **Abstraction** - Process of ignoring what is particular or incidental and emphasizing what is general and essential.
- **A constraint** – statement of a clear criterion that must be satisfied by a product and requires consideration of entire product to determine the criterion value.

- **Basic function**
 - Describes the **characteristics or task** which is the primary reason for the existence of the item.
 - It is what the product or process was actually designed to.
- **Secondary function** - Are designed in functions which are required to **cause or allow the basic function to occur**.
 - It is any function that directly contributes to accomplishing the basic function.
 - It can be further divided into several other categories which are known as sub-groups.

- **Dependent function**
 - A function that **depends on another function** for its existence.
 - Comes into existence when a specific method is selected.
- **Independent function**
 - **Does not depend upon one other functions** for its existence or on the method selected to perform those functions
- **Support functions**
 - A function which **assists a critical function** in doing its job so that it may be done in a reliable and acceptable manner.

- **Critical path functions**
 - Any system which describe specifically how or why another functions are performed.
- **Higher order functions**
 - Appear in **left hand portion of the diagram.**
- **Lower order functions**
 - Appear in **right hand portion of the diagram.**
 - Their existence depends on the relevance of higher order functions.

Function trees

- **Two approaches**
 - FAST method
 - Subtract and Operate Procedure

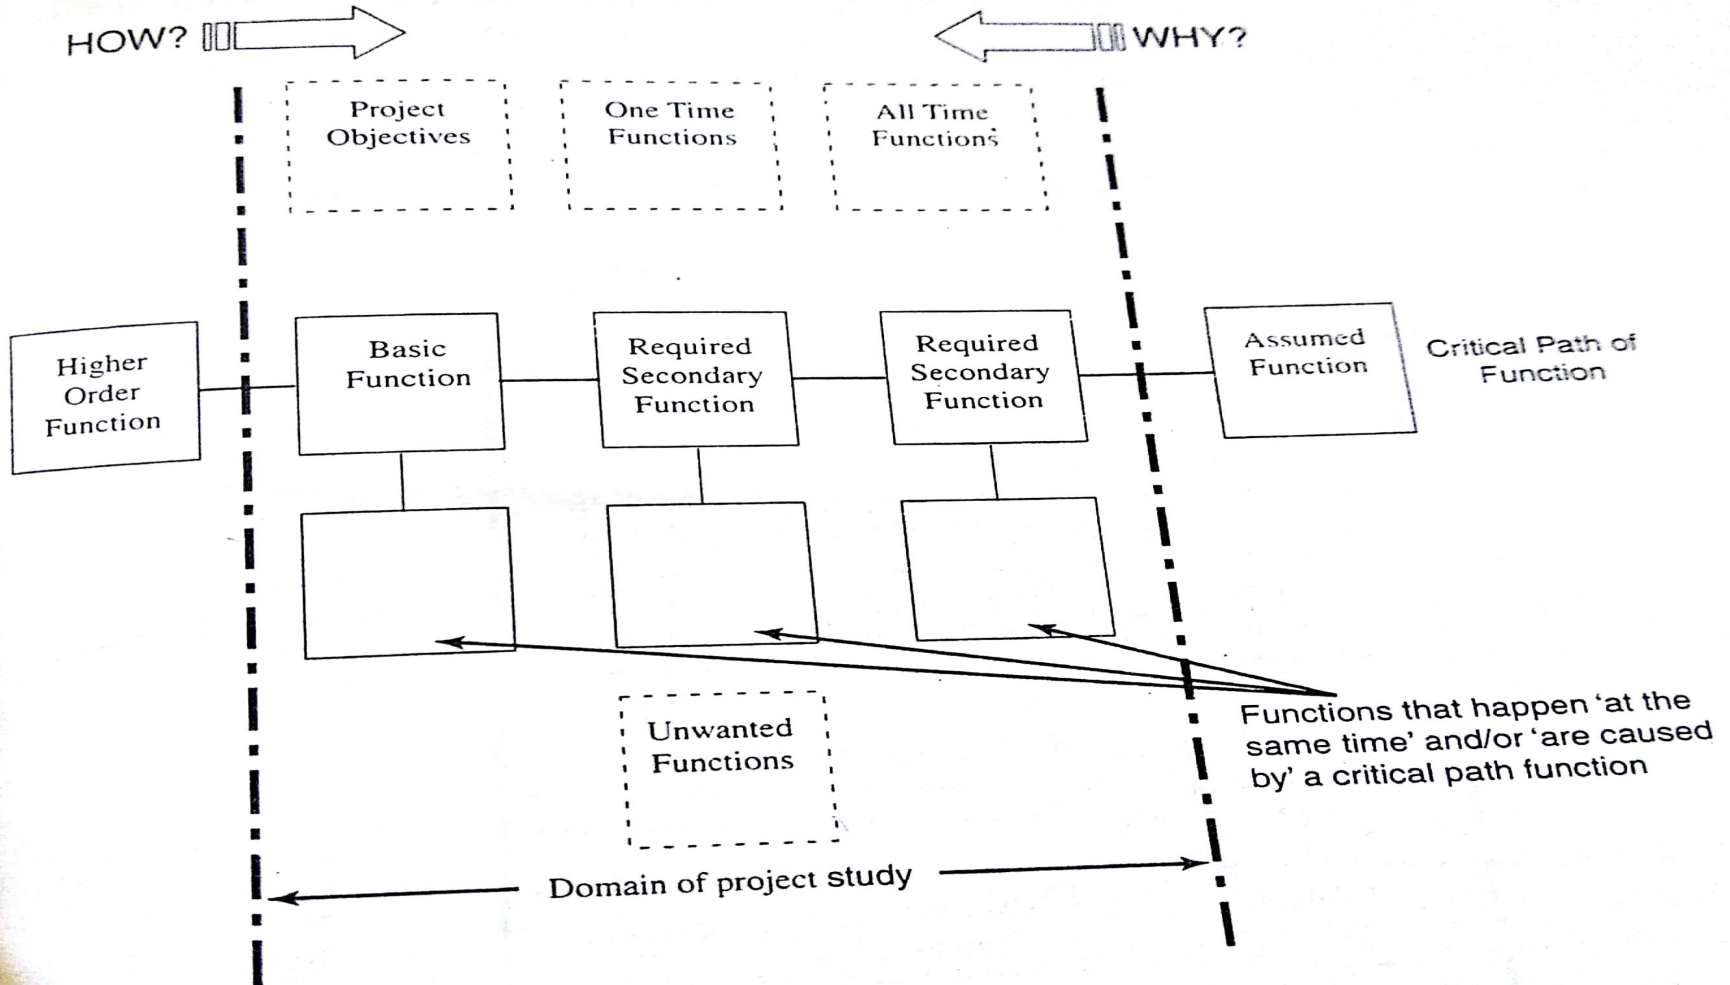

Fast method

- **Function Analysis System Technique (FAST)**
- **Top down approach**
- Used to **define, analyse and understand product functions**, how the functions relate to one another, which functions require attention to increase the product value.
- Hierarchical approach for modelling the function of a product or system.
- Used to
 - Display functions in a logical sequence,
 - Prioritize them and
 - Test their dependency.

FAST Method

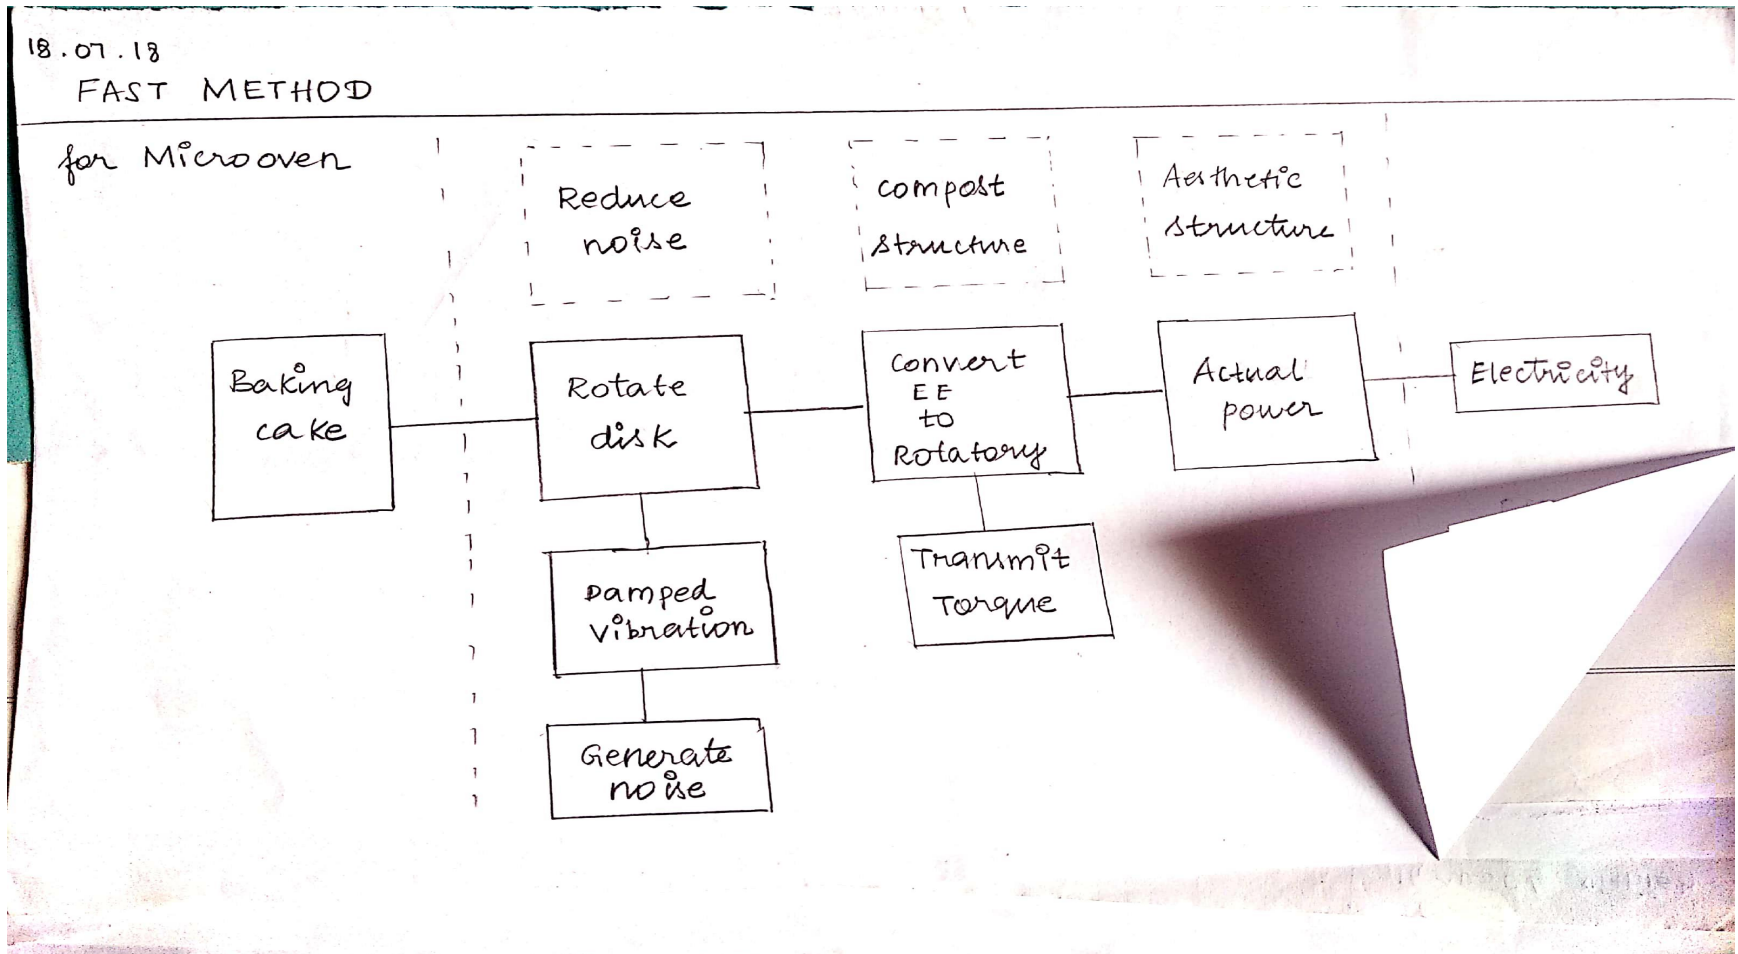

Procedure

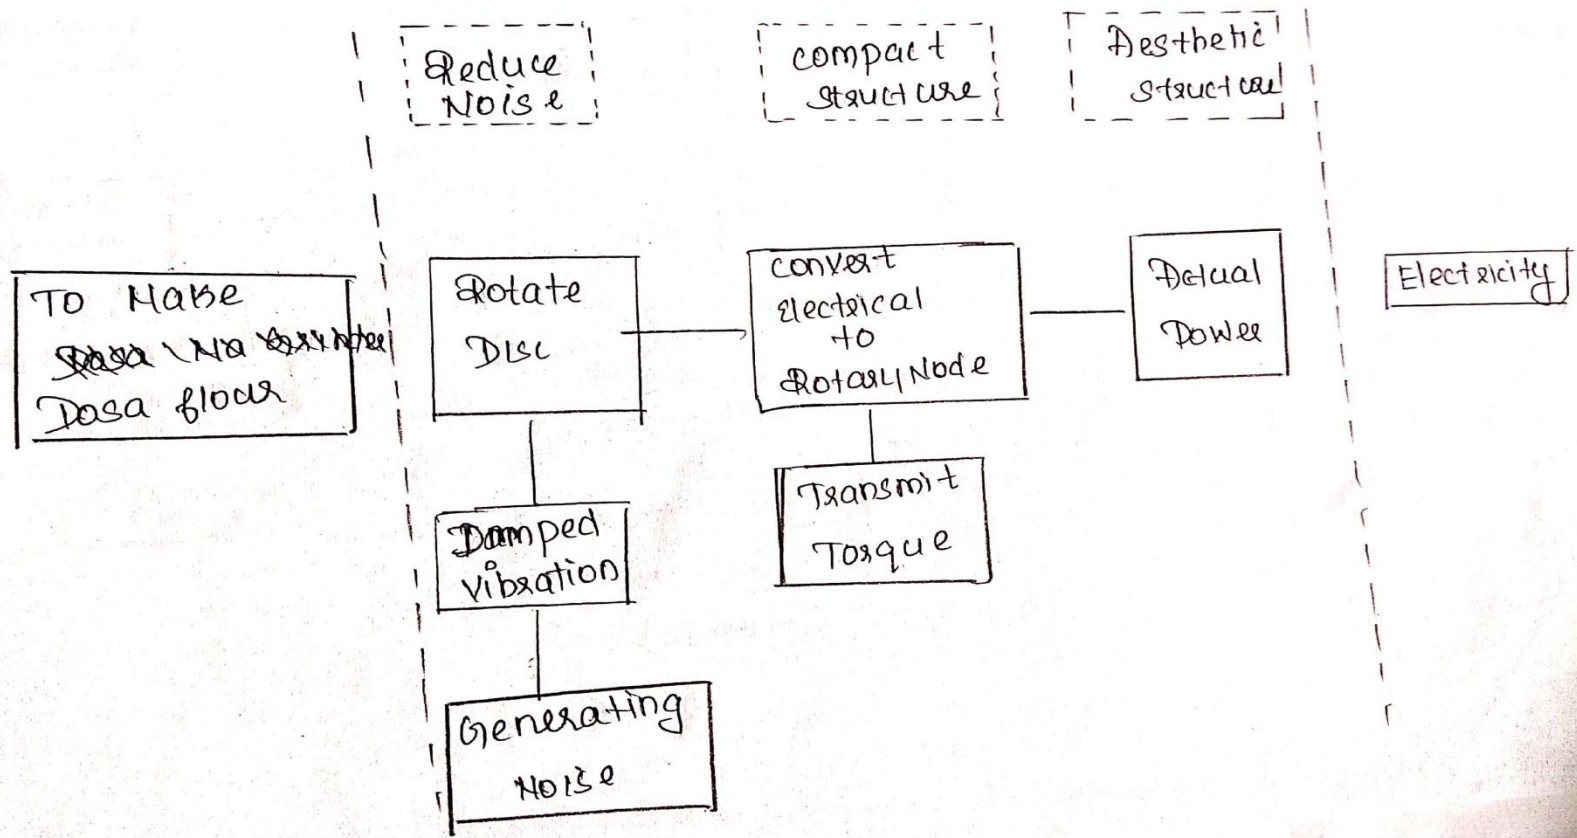

1. Construct **two vertical lines**, dashed lines, one to the extreme left and one to the right. Scope of product development objective.
2. **Basic function** – right of the left hand scope line. Why? Left of the basic function and connect it with line.
3. **Secondary function** – right of basic function.
4. **Assumed function** – outside the right scope line.
5. Generate **remaining secondary functions**.
6. **Objective** – above the basic functions.

Case study: Baking cake

Example: Dosa Flour

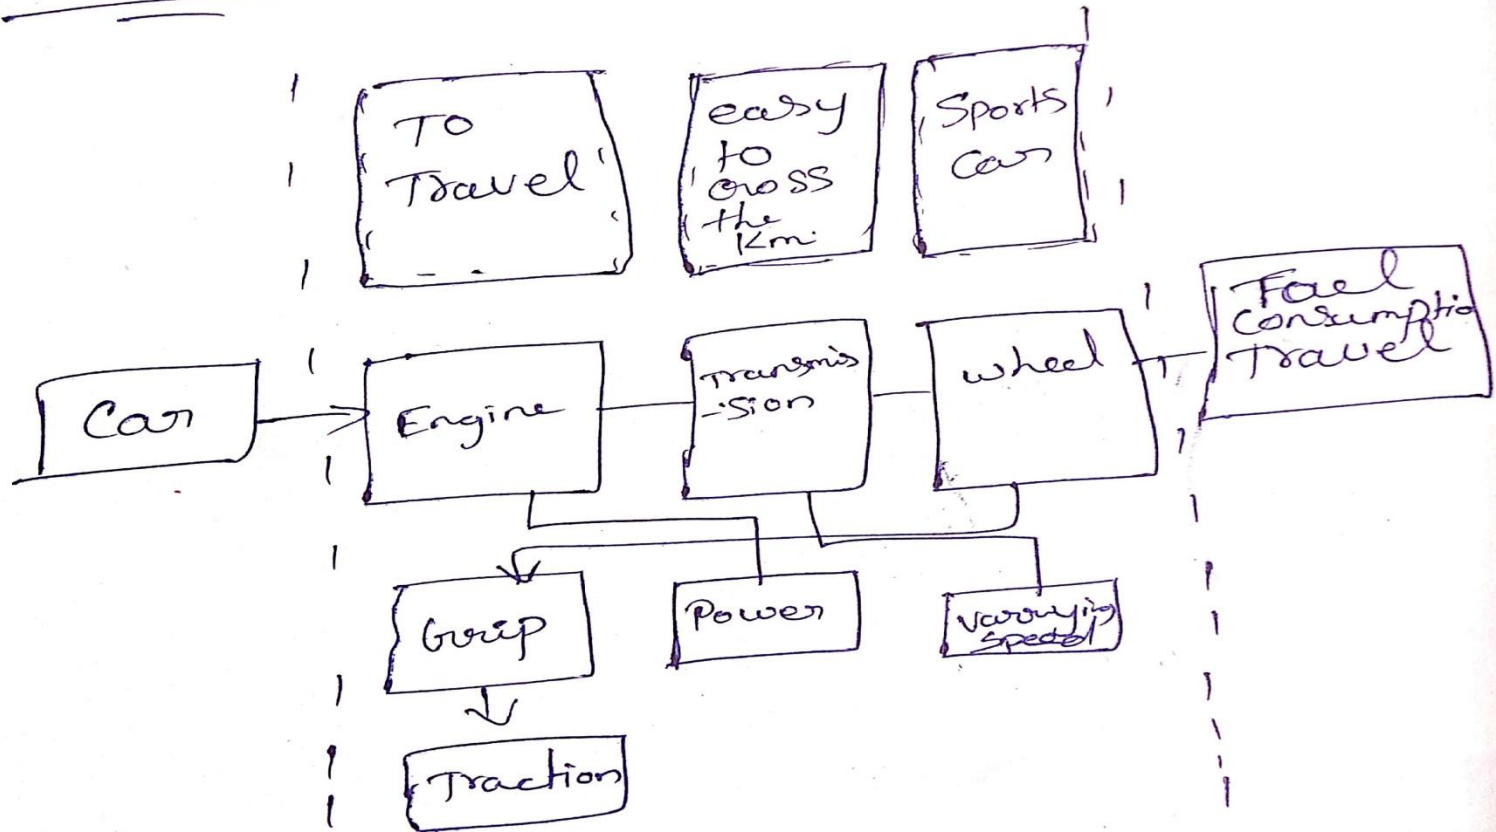

Example: Car

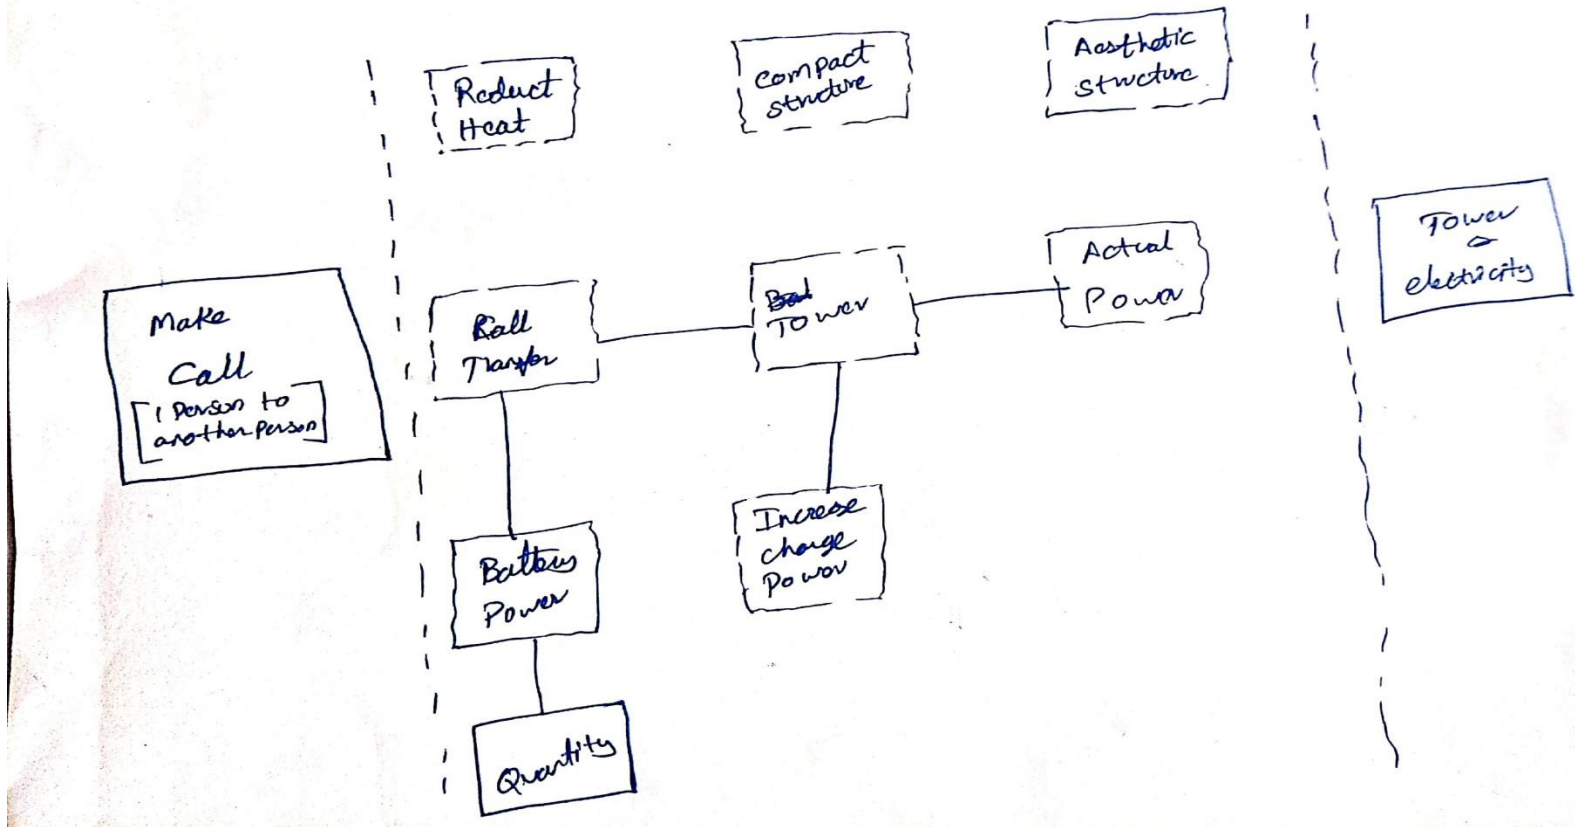

FAST Method :-

Example: Phone Call

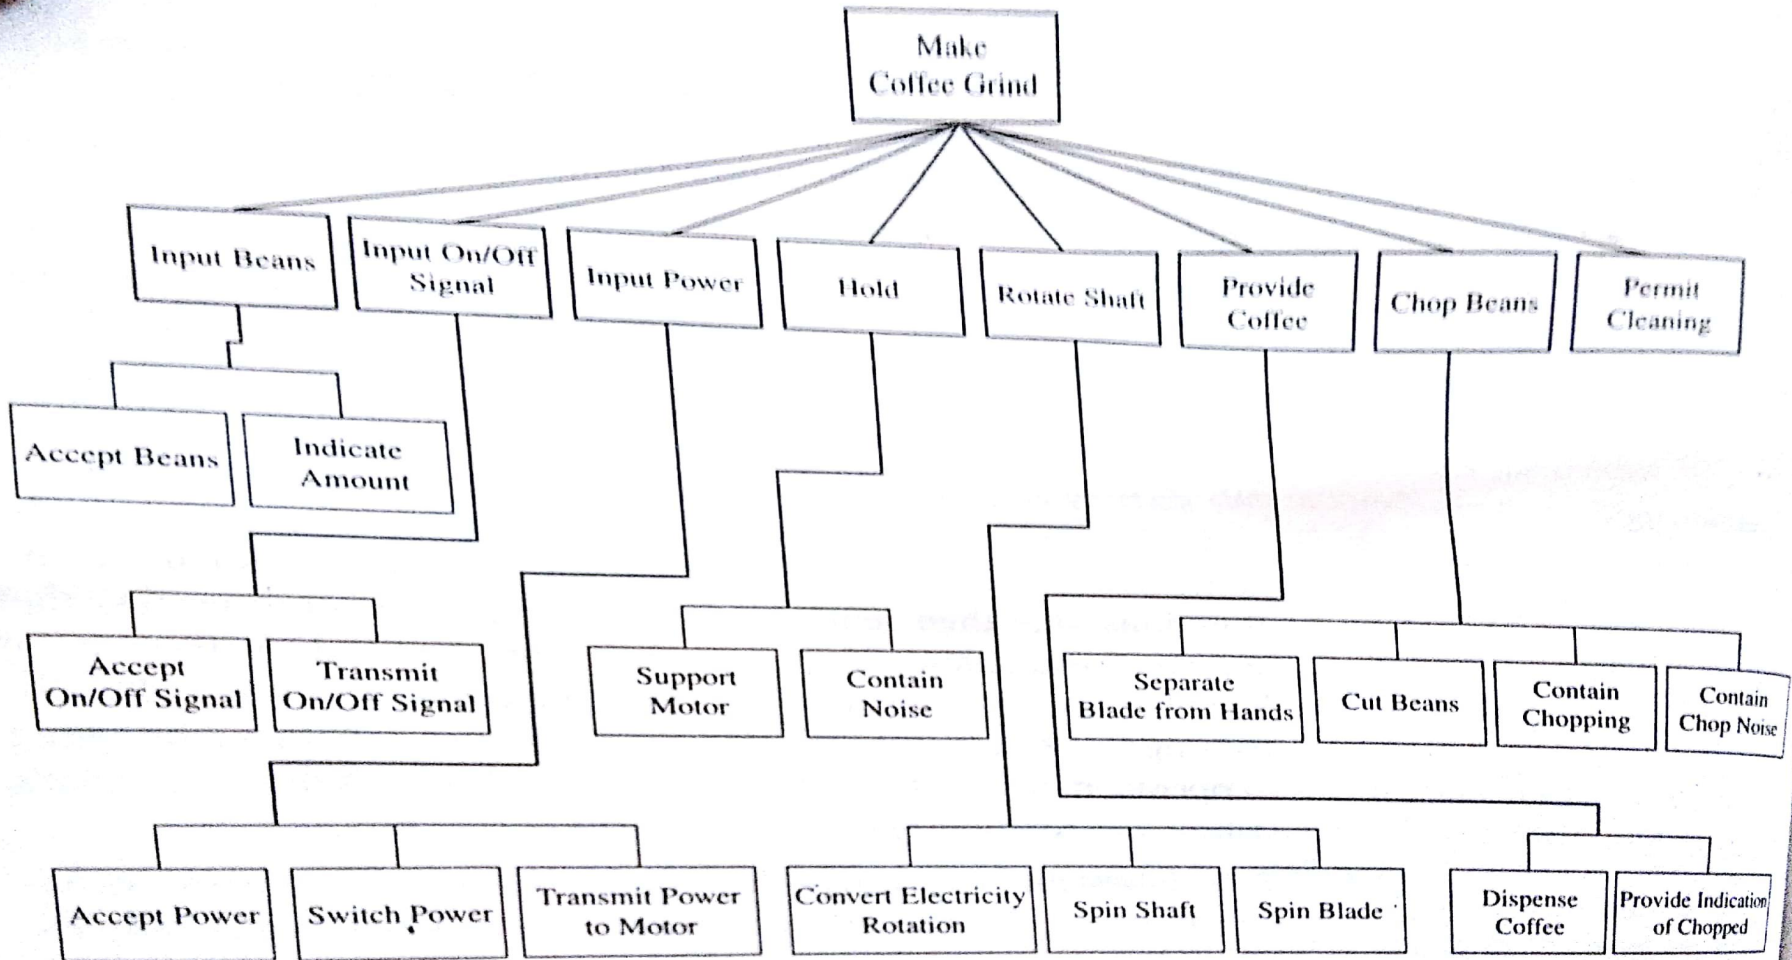

Subtract and operate procedure

- **Bottom up approach**

1. **Disassemble** (Subtract) one component of the assembly.
2. **Operate** the system through its full range.
3. **Analyze** the effect.
4. **Deduce** the subfunction of the missing component.
5. **Replace** the component and repeat the procedure n times, where n is the number of components in the assembly.
6. **Translate** the collection of subfunctions into a function tree.
