Periodic function:

A function f(x) which satisfies the relation f(x+T) = f(x) for all x and some T is called a periodic function. The smallest positive number T for which the relation holds is called the period of f(x).

Example:

- t Sinx, cosx are periodic function with period att.
- * Sinnx and cosnx are periodic function with period 21
- * tanx is a periodic function with period

Dirichlet's Conditions:

- * f(x) is periodic, single valued and finite.
- * f(x) has finite number of finite discontinuities in any one period.
- * f(x) has a finite number of maxima
