(An Autonomous Institution) COIMBATORE-35

Accredited by NBA-AICTE and Accredited by NAAC – UGC with A+ Grade Approved by AICTE, New Delhi & Affiliated to Anna University, Chennai

19GET277 / Biology For Engineers
IV YEAR / VII SEMESTER
UNIT-III: GENETICS AND IMMUNE SYSTEM

EVOLUTION: THEORIES OF EVOLUTION

Charles Darwin

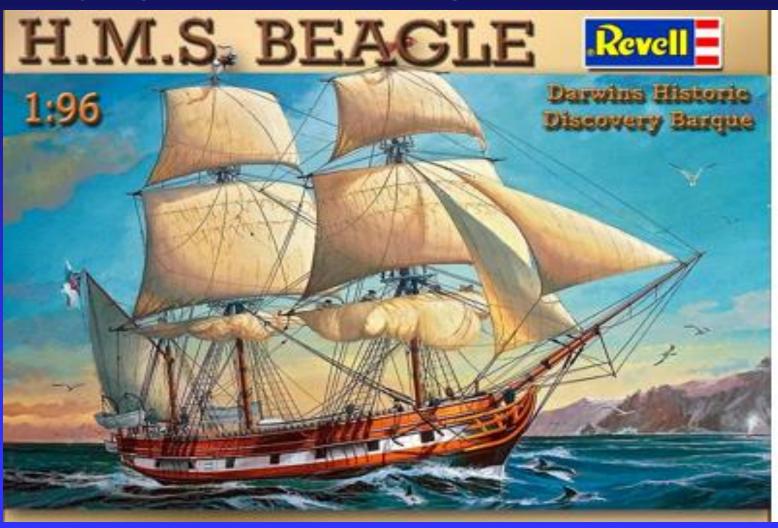

Darwin's Theory of Evolution

Evolution, or change over time, is the process by which modern organisms have descended from ancient organisms.

A scientific <u>theory</u> is a well-supported testable explanation of phenomena that have occurred in the natural world.

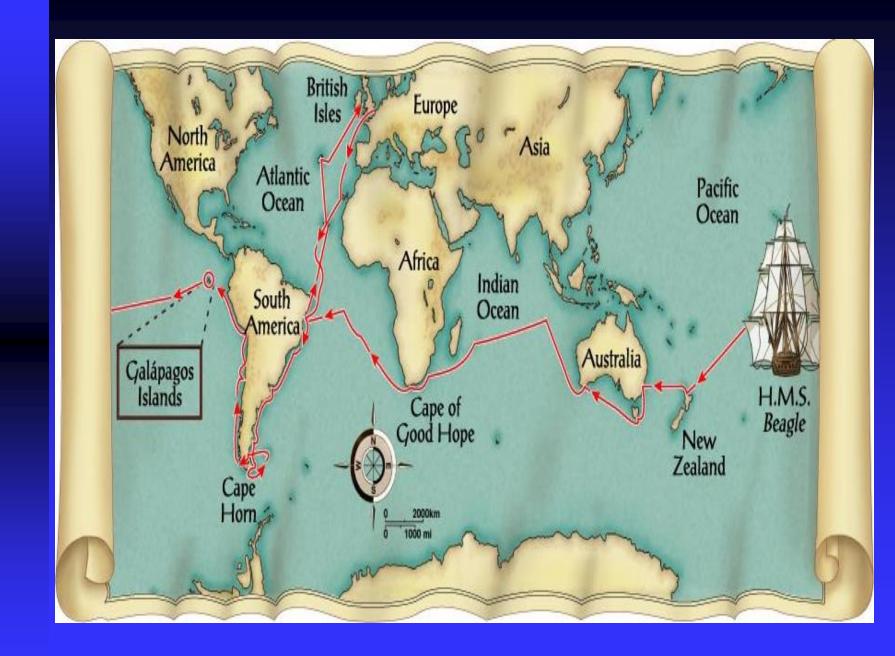

How do you think Darwin came up with his theory?

Voyage of the Beagle

Voyage of Beagle

- Dates: February 12th, 1831
- **Captain:** Charles Darwin
- Ship: H.M.S. Beagle
- **Destination:** Voyage around the world.
- Findings: evidence to propose a revolutionary hypothesis about how life changes over time

Patterns of Diversity

Darwin visited Argentina and Australia which had similar grassland ecosystems.

◆ those grasslands were inhabited by very different animals.

 neither Argentina nor Australia was home to the sorts of animals that lived in European grasslands.

Patterns of Diversity

- Darwin posed challenging questions.
 - ◆ Why were there no rabbits in Australia, despite the presence of habitats that seemed perfect for them?

Why were there no kangaroos in England?

Living Organisms and Fossils

Darwin collected the preserved remains of ancient organisms, called <u>fossils</u>.

■ Some of those fossils resembled organisms that were still alive today.

Living Organisms and Fossils

Others looked completely unlike any creature he had ever seen.

- As Darwin studied fossils, new questions arose.
 - ♦ Why had so many of these species disappeared?

♦ How were they related to living species?

Fossils

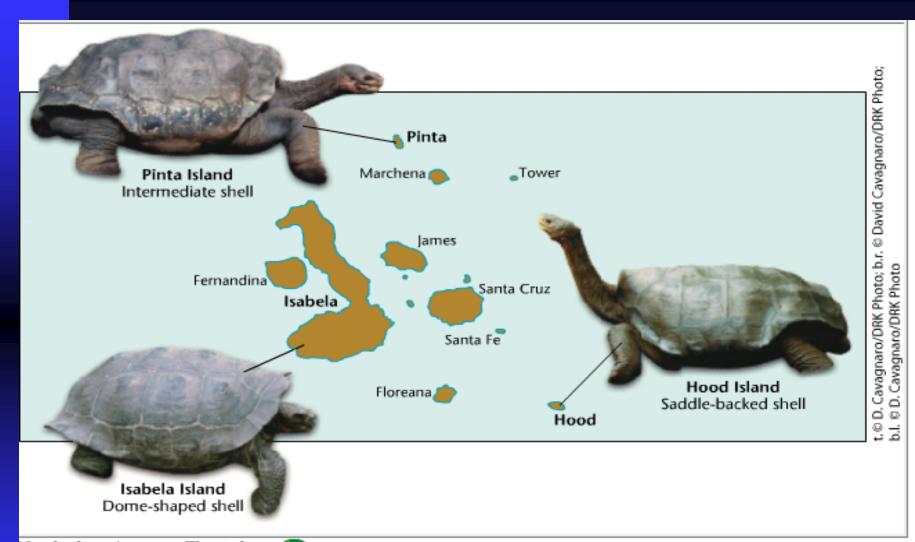

The Galapagos Island

The smallest, lowest islands were hot, dry, and nearly barren-Hood Island-sparse vegetation

The higher islands had greater rainfall and a different assortment of plants and animals-Isabela- Island had rich vegetation.

The Galapagos Island

- Darwin was fascinated in particular by the land tortoises and marine iguanas in the Galápagos.
- Giant tortoises varied in predictable ways from one island to another.
- The shape of a tortoise's shell could be used to identify which island a particular tortoise inhabited.

Variation Among Tortoises Darwin observed that the characteristics of many animals and plants varied noticeably among the different Galápagos Islands. Among the tortoises, the shape of the shell corresponds to different habitats. The Hood Island ortoise (right) has a long neck and a shell that is curved and open around the neck and legs, allowing the tortoise to reach the sparse regetation on Hood Island. The tortoise from Isabela Island (lower left) has a dome-shaped shell and a shorter neck. Vegetation on this sland is more abundant and closer to the ground. The tortoise from Pinta Island has a shell that is intermediate between these two forms.

Animals found in the Galapagos

- Land Tortoises
- Darwin Finches
- Blue-Footed Booby
- Marine Iguanas

Animals

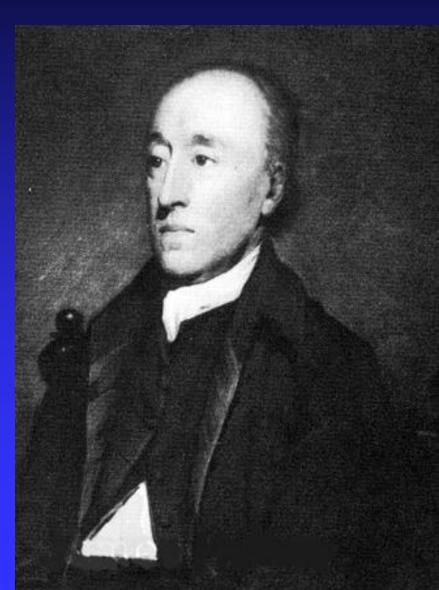

The Journey Home

 Darwin Observed that characteristics of many plants and animals vary greatly among the islands

■ **Hypothesis:** Separate species may have arose from an original ancestor

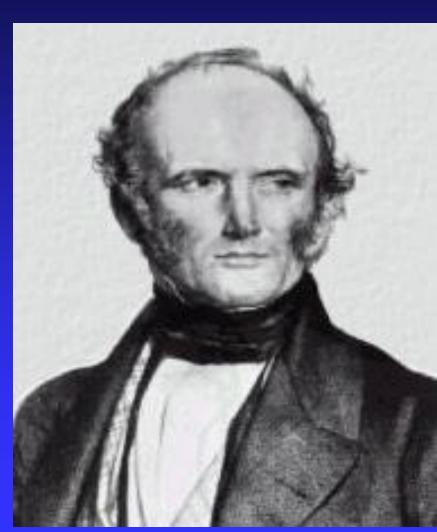

Ideas that shaped Darwin's Thinking

- **■** James Hutton:
- 1795 Theory of Geological change
 - Forces change earth's surface shape
 - Changes are slow
 - Earth much older than thousands of years

Ideas that Shaped Darwin's Thinking

- Charles Lyell
- Book: Principles of Geography
- Geographical features can be built up or torn down
- Darwin thought if earth changed over time, what about life?

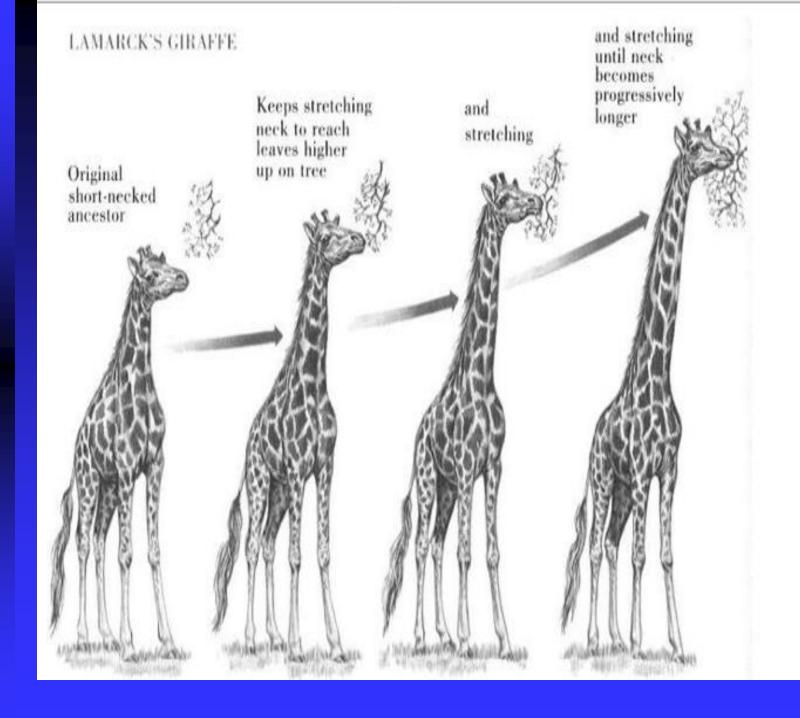

Lamarck

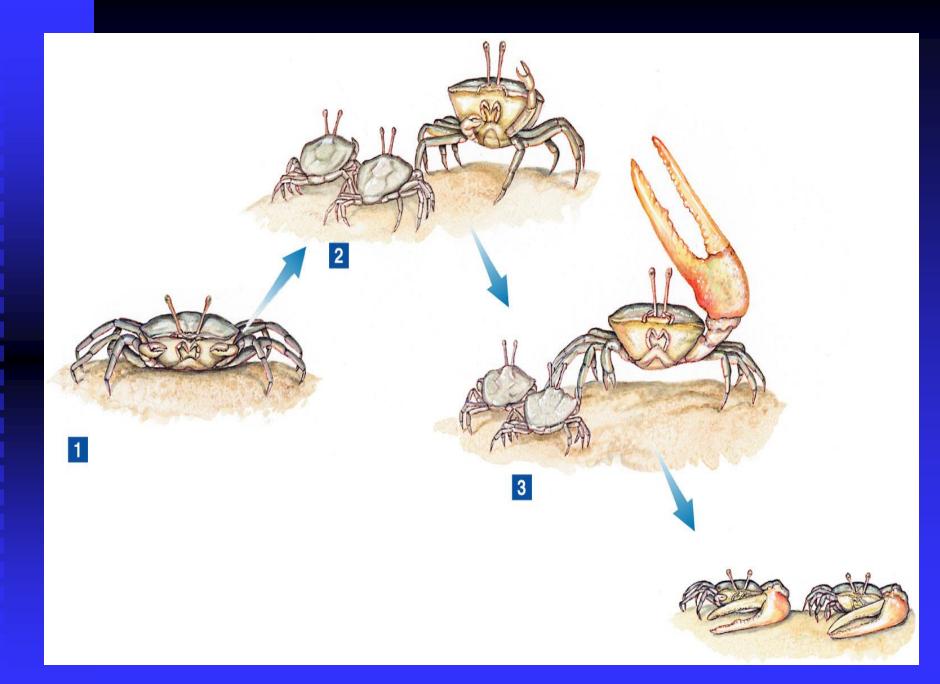

Lamarck's Theory of Evolution

Tendency toward Perfection(Giraffe necks)

- Use and Disuse (bird's using forearms)
- Inheritance of Acquired Traits

Population Growth

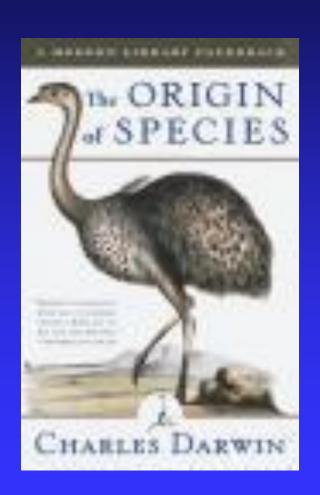

- Thomas Malthus-19th century English economist
- If population grew (more Babies born than die)
 - Insufficient living space
 - ◆ Food runs out
 - Darwin applied this theory to animals

Publication of Orgin of Species

 Russel Wallace wrote an essay summarizing evolutionary change from his field work in Malaysia

Gave Darwin the drive to publish his findings

Natural Selection & Artificial Selection

■ Natural variation--differences among individuals of a species

■ Artificial selection- nature provides the variation among different organisms, and humans select those variations they find useful.

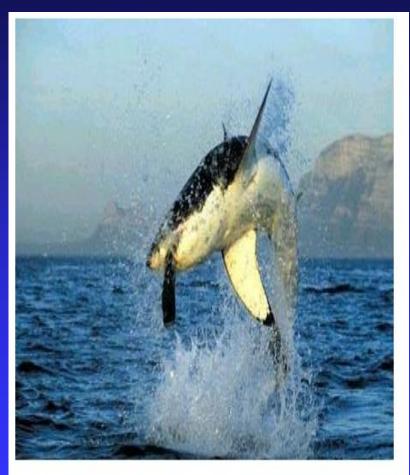

Evolution by Natural Selection

■ The Struggle for Existence-members of each species have to compete for food, shelter, other life necessities

■ Survival of the Fittest-Some individuals better suited for the environment

Natural Selection

Over time, natural selection results in changes in inherited characteristics of a population. These changes increase a species fitness in its environment

Descent

- **Descent with Modification**-Each living organism has descended, with changes from other species over time
- **Common Descent** were derived from common ancestors

Evidence of Evolution

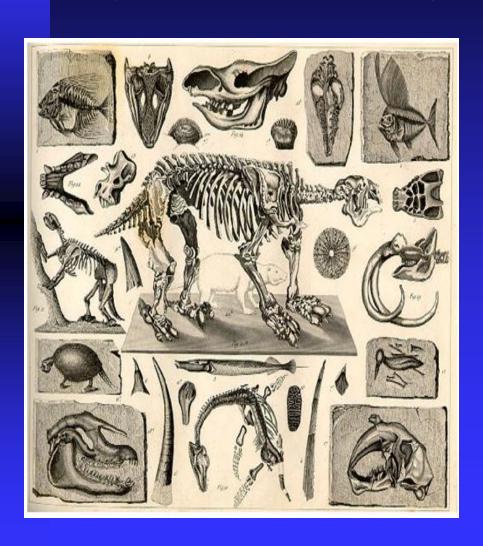

■ The Fossil Record

Geographic Distribution of Living Things

Homologous Body Structures

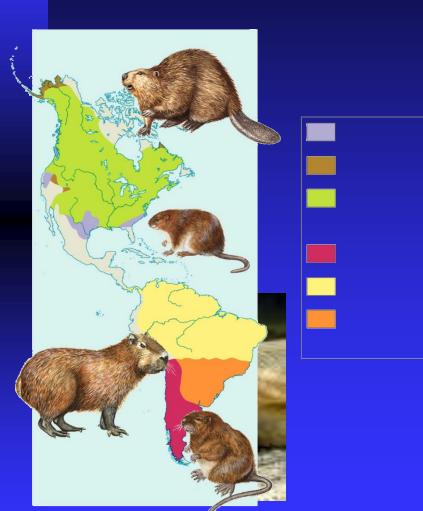

Similarities in Early Development

Evidence for Evolution

- The Fossil Record-Layer show change
- GeographicDistribution of LivingThings
- Homologous Body Structures
- Similarities in Early Development

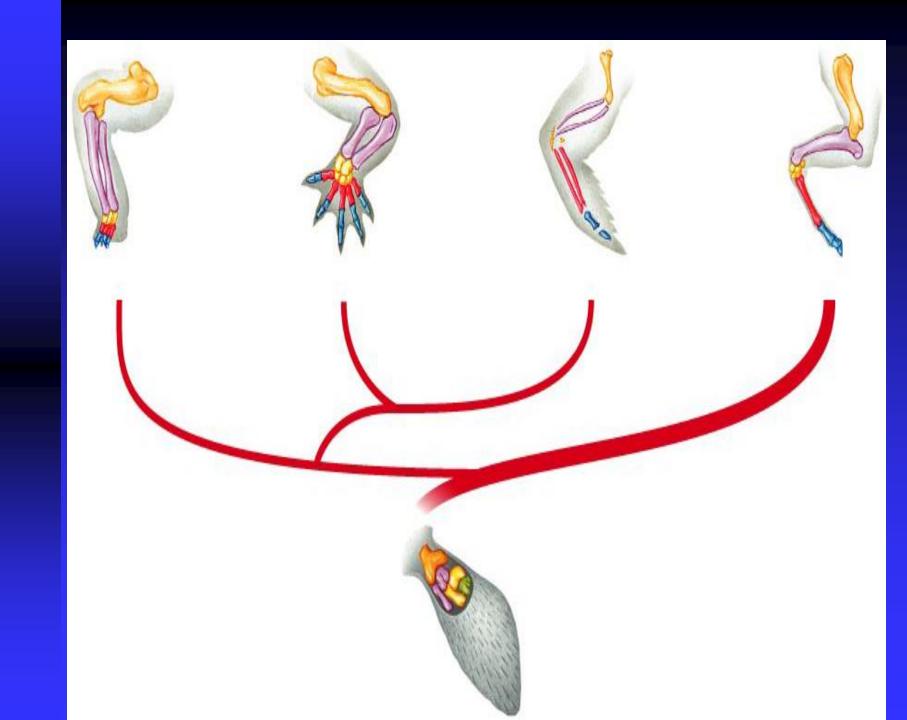

Evidence of Evolution

- The Fossil Record
- Geographic
 Distribution of
 Living Things-similar
 environments have
 similar types of
 organisms
- Homologous Body Structures
- Similarities in Early Development

Homologous Structures

■ Homologous Structures-structures that have different mature forms in different organisms, but develop from the same embryonic tissue

Evidence for Evolution

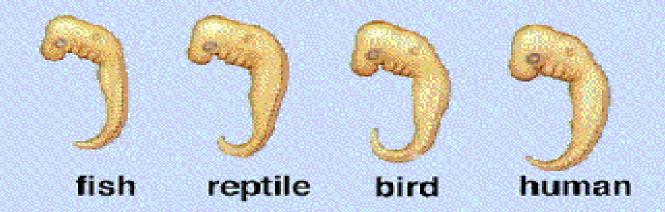

- Vestigial organs-organs that serve no useful function in an organism
- i.e.) appendix, miniature legs, arms

Similarities in Early Development

Comparative Embryology

@ 1995 Wedsworth Publishing Company ITP

Summary of Darwin's Theory

Individuals in nature differ from one another

Organisms in nature produce more offspring than can survive, and many of those who do not survive do not reproduce.

Summary of Darwin's Theory

 Because more organisms are produce than can survive, each species must struggle for resources

 Each organism is unique, each has advantages and disadvantages in the struggle for existence

Summary (cont.)

 Individuals best suited for the environment survive and reproduce most successful

Species change over time

Summary (cont.)

 Species alive today descended with modification from species that lived in the past

All organisms on earth are united into a single family tree of life by common descent
