INSTITUTIONS

# Recap the previous Class

# Floating point numbers

- ❑ Representation for non - integral numbers
  - Including very small and very large numbers
- ❑ Like scientific notation
  - $-2.34 \times 10^{56}$  - Normalized
  - $+0.002 \times 10^{-4}$  – Not Normalized
  - $+987.02 \times 10^9$  – Not Normalized
- ❑ In binary
  - $\pm 1.xxxxxxx_2 \times 2^{yyyy}$

# Floating point Standard

Defined by IEEE Std754 - 1985

Two representations

- Single precision (32 - bit)
- Double precision (64 - bit)

	<b>Sign</b>	<b>Exponent</b>	<b>Fraction</b>	<b>Bias</b>
Single precision	1[31]	8[30-23]	23[22-00]	127
Double precision	1[63]	11[62-52]	52[51-00]	1023

# IEEE Floating point Representation

$$x = (-1)^S \times (1 + \text{Fraction}) \times 2^{(\text{Exponent} - \text{Bias})}$$

**Exponent : excess representation: actual exponent + Bias**

Ensures exponent is unsigned

single: 8 bits

single: 23 bits

double: 11 bits

double: 52 bits

S: sign bit

0 –non - negative

1 - negative

Single: Bias = 127

Double: Bias = 1023

# Floating Point Example

Represent 0.75 in Single and Double precession

Step 1: Convert decimal to binary Number  $0.75 \text{ ----- } 0.11$

Step 2: Scientific Notation  $0.11 \text{ ----- } 0.11 \times 2^0$

Step 3: Normalize the Scientific Notation  $0.11 \times 2^0 \text{ ----- } 1.1 \times 2^{-1}$

**0 | 01111110 | 100000000000000000000000**

$$x = (-1)^S \times (1 + \text{Fraction}) \times 2^{(\text{Exponent} - \text{Bias})}$$

$$\begin{aligned} \text{Exponent} &= \text{Actual Exponent} + \text{Bias} \\ &= -1 + 127 = 126 \end{aligned}$$

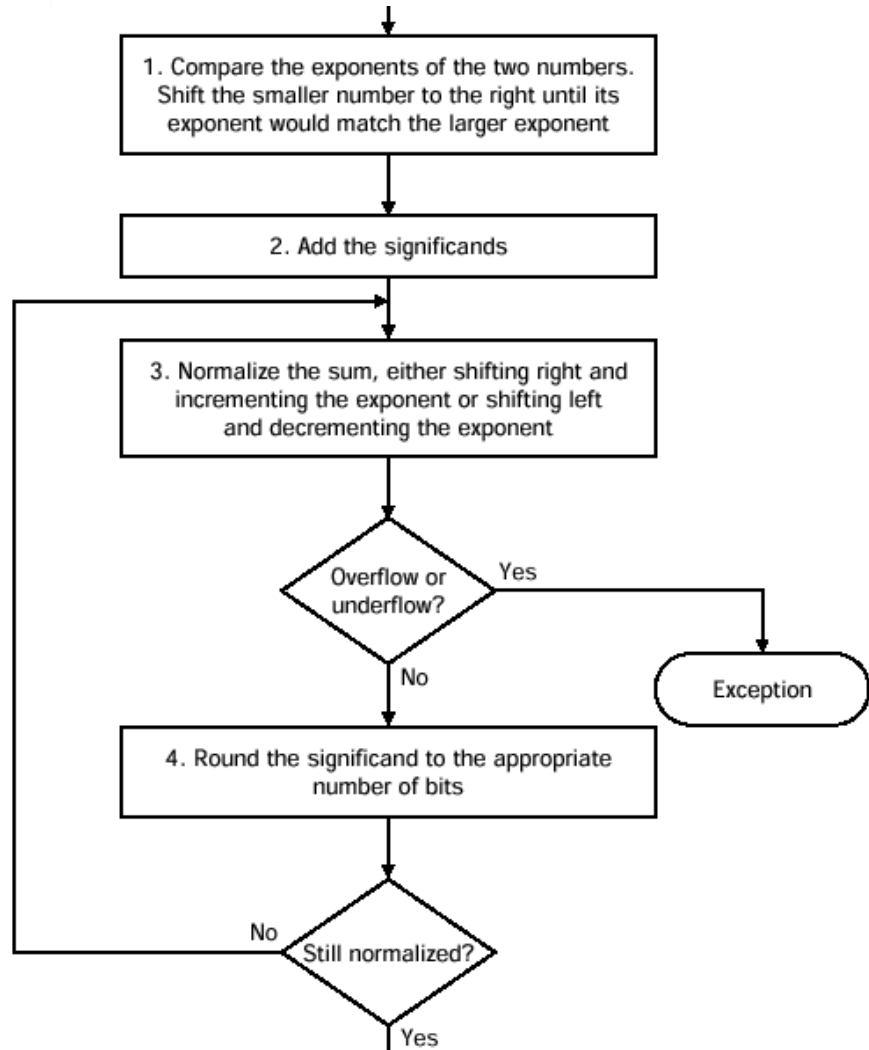

$$X = 1 \times (1.1) \times 2^{126-127}$$

# Example for Floating Point Representation

- Represent  $-0.75$ 
  - $-0.75 = (-1)^1 \times 1.1_2 \times 2^{-1}$   
 $= -1 \times 1. \frac{1}{2} \times \frac{1}{2}$   
 $= -1.5 * .5 = -0.75$
  - $S = 1$
  - Fraction =  $1000\dots00_2$
  - Exponent =  $-1 + \text{Bias}$ 
    - Single:  $-1 + 127 = 126 = 01111110_2$
    - Double:  $-1 + 1023 = 1022 = 01111111110_2$
- Single:  $10111111101000\dots00$
- Double:  $101111111111101000\dots00$

# Floating Point Operation - Addition

OVERFLOW – Positive Exponent too larger to fit in the exponent Field

UNDERFLOW – negative Exponent too larger to fit in the exponent Field

# Example - Floating Point Operation - Addition

Consider a 4-digit decimal example  $9.999 \times 10^1 + 1.610 \times 10^{-1}$

1. Align decimal points

- Shift number with smaller exponent  $9.999 \times 10^1 + 0.016 \times 10^1$

2. Add significands

- $9.999 \times 10^1 + 0.016 \times 10^1 = 10.015 \times 10^1$

3. Normalize result & check for over/underflow

- $1.0015 \times 10^2$

4. Round and renormalize if necessary

- $1.002 \times 10^2$

# Example - Floating Point Operation - Addition

Now consider a 4-digit binary example ( $0.5 + -0.4375$ )

$$1.000_2 \times 2^{-1} + -1.110_2 \times 2^{-2}$$

1. Align binary points

- Shift number with smaller exponent  $1.000_2 \times 2^{-1} + -0.111_2 \times 2^{-1}$

2. Add significands

- $1.000_2 \times 2^{-1} + -0.111_2 \times 2^{-1} = 0.001_2 \times 2^{-1}$

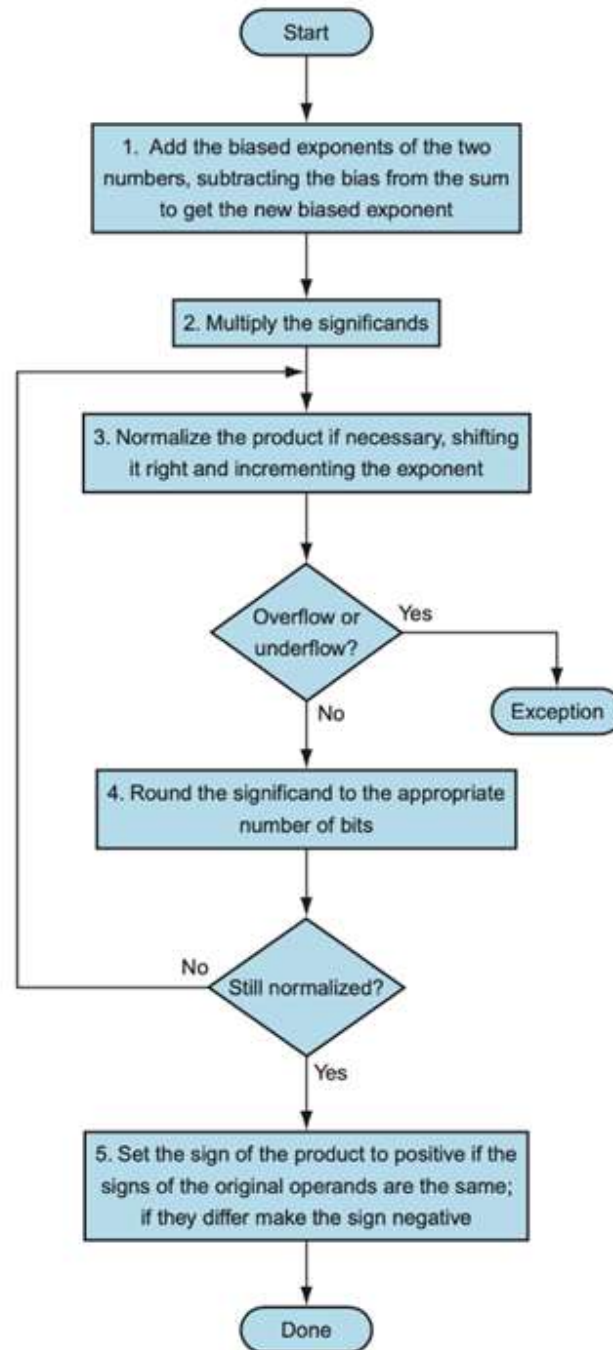

3. Normalize result & check for over/underflow

- $1.000_2 \times 2^{-4}$ , with no over/underflow

4. Round and renormalize if necessary

$$1.000_2 \times 2^{-4} \text{ (no change)} = 0.0625$$

# Floating Point Operation - Multiplication

# Floating Point Multiplication

Consider a 4-digit decimal  $1.110 \times 10^{10} \times 9.200 \times 10^{-5}$

**Add exponents** - For biased exponents, subtract bias from sum

$$\text{New exponent} = 10 + -5 = 5$$

$$\text{Unbiased} = 5 + 127 = 132$$

**Multiply significands**

$$1.110 \times 9.200 = 10.212 = 10.212 \times 10^5$$

**Normalize result & check for over/underflow**

$$1.0212 \times 10^6$$

**Round and renormalize if necessary**

$$1.021 \times 10^6$$

**Determine sign of result from signs of operands**

$$+1.021 \times 10^6$$

# Floating Point Multiplication

Consider a 4-digit binary  $1.000_2 \times 2^{-1} \times -1.110_2 \times 2^{-2}$  ( $0.5 \times -0.4375$ )

## Add exponents

Unbiased:  $-1 + -2 = -3$  ; Biased:  $= -3 + 127 = 124$

## Multiply significands

$1.000_2 \times 1.110_2 = 1.110_2 \Rightarrow 1.110_2 \times 2^{-3}$

## Normalize result & check for over/underflow

$1.110_2 \times 2^{-3}$  (no change) with no over/underflow

## Round and renormalize if necessary

$1.110_2 \times 2^{-3}$  (no change)

**Determine sign:** +ve  $\times$  -ve  $\Rightarrow$  -ve

$-1.110_2 \times 2^{-3} = -0.21875$

# Guard bit and Truncation

- Guard bits
  - Extra bits during intermediate steps to yield maximum accuracy in the final result
- They need to be removed when generating the final result
  - Chopping
    - simply remove guard bits
  - Von Neumann rounding
    - if all guard bits 0, chop, else 1
  - Rounding
    - Add 1 to LSB if guard MSB = 1
