TYPE II : Problems :

- ① A rod of length 'l' has its ends A and B kept at  $0^{\circ}\text{C}$  and  $120^{\circ}\text{C}$  respectively until steady state conditions prevail. If the temperature at B reduced to  $0^{\circ}\text{C}$  and kept so while that of A is maintained, find the temperature distribution in the rod.

Solution :

In steady state :

$$\frac{d^2u}{dx^2} = 0$$

The boundary conditions are,

(i)  $u(0) = 0$

(ii)  $u(l) = 120$

The steady state solution is,

$$u(x) = ax + b \rightarrow \textcircled{1}$$

Applying condition (i) in  $\textcircled{1}$ ,

$$u(0) = a(0) + b = 0$$

$$\boxed{b = 0}$$

Applying condition (ii) in  $\textcircled{1}$ ,

$$u(l) = al + b = 120$$

$$al = 120$$

$$\boxed{a = \frac{120}{l}}$$

subs a and b in  $\textcircled{1}$ ,

$$u(x) = \frac{120x}{l}, \quad 0 \leq x \leq l.$$

If the temperature at B is reduced to  $0^\circ\text{C}$ , then the temperature distribution changes from steady state to unsteady state. (29)

Step 1: The one dimensional heat equation is,

$$\frac{\partial u}{\partial t} = \alpha^2 \frac{\partial^2 u}{\partial x^2}$$

Step 2: The boundary conditions are,

(i)  $u(0, t) = 0 \quad \forall t \geq 0$

(ii)  $u(l, t) = 0 \quad \forall t \geq 0$

(iii)  $u(x, 0) = \frac{120x}{l}, \quad 0 < x < l.$

Step 3: The correct solution is

$$u(x, t) = (c_1 \cos px + c_2 \sin px) e^{-\alpha^2 p^2 t} \rightarrow \textcircled{1}$$

Step 4: Applying (i) in  $\textcircled{1}$ ,

$$u(0, t) = c_1 e^{-\alpha^2 p^2 t} = 0$$

Here  $e^{-\alpha^2 p^2 t} \neq 0$  [ $\because$  It is defined for all  $t$ ]

$$\therefore c_1 = 0$$

$$\textcircled{1} \Rightarrow u(x, t) = c_2 \sin px e^{-\alpha^2 p^2 t} \rightarrow \textcircled{2}$$

Step 5: Applying (ii) in  $\textcircled{2}$ ,

$$u(l, t) = c_2 \sin pl e^{-\alpha^2 p^2 t} = 0$$

Here  $e^{-\alpha^2 p^2 t} \neq 0$  [ $\because$  It is defined for all  $t$ ]

$$c_2 \neq 0 \quad [\because c_1 = 0 \text{ we get a trivial solution}]$$

$$\therefore \sin pl = 0 = \sin n\pi$$

$$pl = n\pi$$

$$p = \frac{n\pi}{l}$$

$$\textcircled{2} \Rightarrow u(x, t) = c_n \sin\left(\frac{n\pi x}{l}\right) e^{-\alpha^2 n^2 \pi^2 t / l^2}$$

$$u(x, t) = c_n \sin\left(\frac{n\pi x}{l}\right) e^{-\alpha^2 n^2 \pi^2 t / l^2}$$

Step 6: The most general solution is,

$$u(x,t) = \sum_{n=1}^{\infty} C_n \sin\left(\frac{n\pi x}{l}\right) e^{-\alpha^2 n^2 \pi^2 t / l^2} \rightarrow (3)$$

Step 7: Applying (ii) in (3),

$$u(x,0) = \sum_{n=1}^{\infty} C_n \sin\left(\frac{n\pi x}{l}\right) = \frac{120x}{l} \rightarrow (4)$$

Step 8: To find  $C_n$ :

Expand  $f(x) = \frac{120x}{l}$  as a half range Fourier sine

series in  $(0, l)$ .

$$f(x) = \sum_{n=1}^{\infty} b_n \sin\left(\frac{n\pi x}{l}\right) \rightarrow (5)$$

$$\text{where } b_n = \frac{2}{l} \int_0^l f(x) \sin\left(\frac{n\pi x}{l}\right) dx$$

From (4) & (5),  $b_n = C_n$

$$C_n = \frac{2}{l} \int_0^l \frac{120x}{l} \sin\left(\frac{n\pi x}{l}\right) dx$$

$$= \frac{240}{l^2} \left[ x \left( \frac{-\cos\left(\frac{n\pi x}{l}\right)}{n\pi/l} \right) + \frac{\sin\left(\frac{n\pi x}{l}\right)}{(n\pi/l)^2} \right]_0^l$$

$$= \frac{240}{l^2} \left[ -l \cdot \frac{l}{n\pi} \cos n\pi \right]$$

$$C_n = -\frac{240}{n\pi} (-1)^n$$

$$C_n = \frac{240}{n\pi} (-1)^{n+1}$$

Step 9: Subs the value of  $C_n$  in (3),

$$u(x,t) = \sum_{n=1}^{\infty} \frac{240}{n\pi} (-1)^{n+1} \sin\left(\frac{n\pi x}{l}\right) e^{-\alpha^2 n^2 \pi^2 t / l^2}$$

Both ends are change to zero temp.

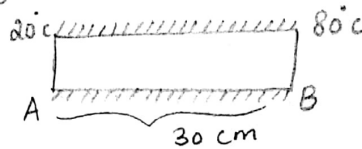

(30)

② A rod 30 cm long has its ends A and B kept at 20°C and 80°C respectively until steady state conditions prevail.

The temperature at each end is then suddenly reduced to 0°C and kept so. Find the resulting temperature function  $u(x,t)$  taking  $x=0$  at A.

Solution:

In Steady State:

The one dimensional heat equation is,

$$\frac{d^2 u}{dx^2} = 0$$

The boundary conditions are,

(i)  $u(0) = 20^\circ\text{C}$

(ii)  $u(30) = 80^\circ\text{C}$

The steady state solution is,

$$u(x) = ax + b \rightarrow \text{①}$$

Applying Condition (i) in ①,

$$u(0) = a(0) + b = 20$$

$$\boxed{b = 20}$$

Applying Condition (ii) in ①,

$$u(30) = a(30) + b = 80$$

$$30a + 20 = 80$$

$$30a = 60$$

$$\boxed{a = 2}$$

Subs a and b in ①,

$$\boxed{u(x) = 2x + 20}$$

If the temperature at each end is reduced to 0°C, then the temperature distribution changes from steady state to unsteady state.

7

Step 1: The one dimensional heat equation is,

$$\frac{\partial u}{\partial t} = \alpha^2 \frac{\partial^2 u}{\partial x^2}$$

Step 2: The boundary conditions are,

(i)  $u(0, t) = 0 \quad \forall t \geq 0$

(ii)  $u(30, t) = 0 \quad \forall t \geq 0$

(iii)  $u(x, 0) = 2x + 20, \quad 0 < x < 30$

Step 3: The correct solution is,

$$u(x, t) = (C_1 \cos px + C_2 \sin px) e^{-\alpha^2 p^2 t} \rightarrow \textcircled{1}$$

Step 4: Applying condition (i) in  $\textcircled{1}$ ,

$$u(0, t) = C_1 e^{-\alpha^2 p^2 t} = 0$$

Here  $e^{-\alpha^2 p^2 t} \neq 0$  [ $\because$  It is defined for all  $t$ ]

$$\therefore \boxed{C_1 = 0}$$

$$\textcircled{1} \Rightarrow u(x, t) = C_2 \sin px e^{-\alpha^2 p^2 t} \rightarrow \textcircled{2}$$

Step 5: Applying condition (ii) in  $\textcircled{2}$ ,

$$u(30, t) = C_2 \sin 30p e^{-\alpha^2 p^2 t} = 0$$

Here  $e^{-\alpha^2 p^2 t} \neq 0$  [ $\because$  It is defined for all  $t$ ]

$$C_2 \neq 0 \quad [\because C_1 = 0 \text{ we get a trivial solution}]$$

$$\sin 30p = 0 = \sin n\pi$$

$$30p = n\pi$$

$$\boxed{p = \frac{n\pi}{30}}$$

$$\textcircled{2} \Rightarrow u(x, t) = C_2 \sin\left(\frac{n\pi x}{30}\right) e^{-\alpha^2 n^2 \pi^2 t / 30^2}$$

$$u(x, t) = C_n \sin\left(\frac{n\pi x}{30}\right) e^{-\alpha^2 n^2 \pi^2 t / 30^2}$$

Step 6: The most general solution is

$$u(x, t) = \sum_{n=1}^{\infty} C_n \sin\left(\frac{n\pi x}{30}\right) e^{-\alpha^2 n^2 \pi^2 t / 30^2} \rightarrow \textcircled{3}$$

(31)

Step 7: Applying condition (iii) in (3),

$$u(x, 0) = \sum_{n=1}^{\infty} C_n \sin\left(\frac{n\pi x}{30}\right) = 2x + 20 \rightarrow (4)$$

Step 8: To find  $C_n$ :

Expand  $f(x) = 2x + 20$  as a half range Fourier sine series in  $(0, 30)$ .

$$f(x) = \sum_{n=1}^{\infty} b_n \sin\left(\frac{n\pi x}{30}\right) \rightarrow (5)$$

$$\text{where } b_n = \frac{2}{30} \int_0^{30} f(x) \sin\left(\frac{n\pi x}{30}\right) dx$$

From (4) & (5),  $b_n = C_n$

$$C_n = \frac{2}{30} \int_0^{30} (2x + 20) \sin\left(\frac{n\pi x}{30}\right) dx$$
$$= \frac{2}{30} \left\{ (2x + 20) \left( \frac{-\cos(n\pi x/30)}{n\pi/30} \right) + 2 \cdot \frac{30^2}{n^2 \pi^2} \sin\left(\frac{n\pi x}{30}\right) \right\}_0^{30}$$

$$= \frac{2}{30} \left\{ (60 + 20) \left( \frac{-30}{n\pi} \right) \cos n\pi + 20 \left( \frac{30}{n\pi} \right) \right\}$$

$$= \frac{2}{30} \cdot \frac{30}{n\pi} \cdot 20 \left\{ 1 - 4 \cos n\pi \right\}$$

$$C_n = \frac{40}{n\pi} [1 - 4(-1)^n]$$

Step 9: Subs the value of  $C_n$  in (3),

$$u(x, t) = \sum_{n=1}^{\infty} \frac{40}{n\pi} [1 - 4(-1)^n] \sin\left(\frac{n\pi x}{30}\right) e^{-\alpha^2 n^2 \pi^2 t / 30^2}$$
