**TOPIC –LINK POWER BUDGET**

# LINK POWER BUDGET

For optimizing link power budget an optical power loss model is to be studied as shown in Fig.

- $L_c$  denotes the losses occur at connector.
- $L_{sp}$  denotes the losses occur at splices.
- $\alpha_f$  denotes the losses occur in fiber.

## POINT TO POINT LINK

All the losses from source to detector comprises the total loss (PT) in the system.

➤ Link power margin considers the losses due to component aging and temperature fluctuations. Usually a link margin of 6-8 dB is considered while estimating link power budget.

Total optical loss = Connector loss + (Splicing loss + Fiber attenuation) + System margin (Pm)

$$PT = 2l_c + \alpha fL + \text{System margin (Pm)}$$

where, L is transmission distance.

**Example 1 :** Design an optical fiber link for transmitting 15 Mb/sec of data for a distance of 4 km with BER of  $10^{-9}$ .

**Solution :**

Bandwidth x Length = 15 Mb/sec x 4 km = (60 Mb/sec) km

Selecting optical source : LED at 820 nm is suitable for short distances.

The LED generates – 10 dBm optical power.

Selecting optical detector : PIN-FER optical detector is reliable and has – 50 dBm sensitivity.

**Selection optical fiber : Step-index multimode fiber is selected. The fiber has bandwidth length product of 100 (Mb/s) km.**

## Links power budget :

Assuming :

Splicing loss  $l_s = 0.5$  dB/slice

Connector loss  $l_c = 1.5$  dB

System link power margin  $P_m = 8$  dB

Fiber attenuation  $\alpha_f = 6$  dB/km

Actual total loss =  $(2 \times l_c) + \alpha_f L + P_m$

$P_T = (2 \times 1.5) + (6 \times 4) + 8$

$P_T = 35$  dB

Maximum allowable system loss :

$P_{max} = \text{Optical source output power} - \text{optical receiver sensitivity}$

$P_{max} = -10$  dBm  $- (-50$  dBm)

$P_{max} = 40$  dBm

Since actual losses in the system are less than the allowable loss, hence the system is functional.

- Example 2 :

A transmitter has an output power of 0.1 mW. It is used with a fiber having NA = 0.25, attenuation of 6 dB/km and length 0.5 km.

The link contains two connectors of 2 dB average loss. The receiver has a minimum acceptable power (sensitivity) of – 35 dBm. The designer has allowed a 4 dB margin. Calculate the link power budget.

## Solution :

Source power  $P_s = 0.1 \text{ mW}$

$P_s = -10 \text{ dBm}$

Since  $NA = 0.25$

Coupling loss =  $-10 \log (NA^2)$

=  $-10 \log (0.25^2) = 12 \text{ dB}$

Fiber loss =  $\alpha f \times L$

$l_f = (6 \text{ dB/km}) (0.5 \text{ km})$

$l_f = 3 \text{ dB}$

Connector loss = 2 (2 dB)

$l_c = 4 \text{ dB}$

Design margin  $P_m = 4 \text{ dB}$

**Actual output power**  $P_{out} = \text{Source power} - (\Sigma \text{ Losses})$

$P_{out} = 10 \text{ dBm} - [12 \text{ dB} + 3 + 4 + 4]$ ,  $P_{out} = \mathbf{-33 \text{ dBm}}$

Since receiver sensitivity given is  $-35 \text{ dBm}$ .

i.e.  $P_{min} = \mathbf{-35 \text{ dBm}}$

As  $P_{out} > P_{min}$ , the system will perform adequately over the system operating life.

**Example 3 :** In a fiber link the laser diode output power is 5 dBm, source-fiber coupling loss = 3 dB, connector loss of 2 dB and has 50 splices of 0.1 dB loss. Fiber attenuation loss for 100 km is 25 dB, compute the loss margin for i) APD receiver with sensitivity – 40 dBm ii) Hybrid PINFET high impedance receiver with sensitivity -32 dBm.

## **Solution : Power budget calculations**

Source output power      5 dBm

Source fiber coupling loss      3 dB

Connector loss      2 dB

Connector loss      5 dB

Fiber attenuation      25 Db

Total loss **35 dB**

Available power to receiver :  $(5 \text{ dBm} - 35 \text{ dBm}) - 30 \text{ dBm}$

i) APD receiver sensitivity – 40 dBm

ii) Loss margin  $[- 40 - (- 30)]$  10dBm

ii) H-PIN FET high impedance receiver -32 dBm

Loss margin  $[- 32 - (- 30)]$  2 dBm
