DEPARTMENT OF COMPUTER SCIENCE AND ENGINEERING

19CSO303-Web Designing (Open Elective)

The WSDL is the key element that enables the web services. It is an XML file that describes the interface for the web service to the outside world.

It is also a key to interoperability, because different clients that use different languages can use the same service, regardless of the underlying technology.

The WSDLs that are provided with the web services package are grouped according to Emptoris® Contract Management logical objects and processes. Each web service provides a specific functional interface or service that exposes the Emptoris Contract Management logical object model and the associated process models to external access.

Note: WSDL is not generated if web services are accessed through the PWS URL. Access to web services is blocked at the CWS layer. Access to the WSDL is allowed only directly from the application server.

WSDL Components

Each WSDL contains the categories of components that are listed here. To view the components in a WSDL definition, append `?WSDL` to the web service URL as follows:

```
https://<hostname>.<domain>:<SSLport>/webservices/services/<Obje
ctServices>?WSDL
```
