

Latin Square Design (LSD) :

It is a three factor experiment

Procedure:

Step 1: Null hypothesis : Ho: There is no significant difference between columns, rows and treatments Alternative hypothesis: H .: There is a significant difference between columns, rows and treatments.

Step 2:
$$\star$$
 Find N
 \star Find T
 \star Find C.F = T^2/N

Step 4: Arrange the data by treatment wise.

$$\# SSK = (\underbrace{SZ_1)^2}_{K} + \underbrace{(SZ_2)^2}_{K} + (\underbrace{SZ_3)^2}_{K} + \dots - C.F$$

Where k - number of treatments (columns).

Step 5: ANOVA Table:

				-
Degree of freedom	Sum of resquares	Mean Sum of squares	Variance Yatio	Table Value
K-1	SSC	MSC = SSC K-1	Fc = MSC MSE	E (V-1 .
K-1	SSR	$MSR = \frac{SSR}{K-1}$	FR = MSR MSE	F _K (K-1, (K-1)(K-2)
K -1	SSK	MEK = SSK K-1	Fr = MSK	Fx (K-1, (K-1)
(K-1)(K-2)	SSE	MSE = SSE $(K-1)(K-2)$	10/31	Fx (K-1,(K-1) (K-2))
	freedom K-1 K-1 K-1	freedom sevuares K-1 SSC K-1 SSR K-1 SSR	freedom requares $K-1$ SSC $MSC = SSC$ $K-1$ $K-1$ SSR $MSR = SSR$ $K-1$ $K-1$ SSR $MSR = SSR$ $K-1$	freedom requares ratio $K-1$ SSC $MSC = SSC$ $K-1$ $F_c = \frac{MSC}{MSE}$ $K-1$ SSR $MSR = \frac{SSR}{K-1}$ $F_R = \frac{MSR}{MSE}$ $K-1$ SSR $MSE = \frac{SSE}{K-1}$

Step 6: Decision:

If $F_C < F_{\alpha}$, $F_R < F_{\alpha}$, $F_K < F_{\alpha}$ it is accepted otherwise it is rejected.

Problems:

(in kgs) of paddy where P, Q, R, S denote the different methods of cultivation.

Examine whether the different methods of cultivation have given significantly different yields.

Soln:

Step1: Null hypothesis: Ho: There is no significant difference between rows, columns and treatments.

Alternative hypothesis: H,; There is a significant difference between rows, columns and treatments.

	orio	gin = 1	120	A .					2
	χ,	x,	x3	×	Total	2(1	X2	×3	x42
<i>y</i> ,	2	,	3	2	8	4	1	9	4
y,	<i>h</i> -	3	2	5	14	16	9	4-	25
<i>y</i> ₃	0	-1	0	1	o	0	1	D	1
	2	3	1	2	8	4	9	1	4
y ₄ Total	8	6	6	10	30	24	20	14	31

Step 2:

$$N = 16$$

$$T = 30$$

$$C.F = \frac{T^2}{N} = \frac{30^2}{16} = 56.25$$

$$Step 3:$$

$$SST = \Xi \chi_1^2 + \Xi \chi_2^2 + \Xi \chi_3^2 + \Xi \chi_4^2 - C.F$$

$$= 24 + 20 + 14 + 34 - 56.25$$

$$SSC = (\frac{\Xi \chi_1}{C_1})^2 + (\underline{\Xi \chi_2})^2 + (\underline{\Xi \chi_3})^2 + (\underline{\Xi \chi_4})^2 - C.F$$

$$= \frac{8^2}{4} + \frac{6^2}{4} + \frac{6^2}{4} + \frac{10^2}{4} - 56.25$$

$$SSC = 2.75$$

$$SSR = (\underline{\Xi y_1})^2 + (\underline{\Xi y_2})^2 + (\underline{\Xi y_3})^2 + (\underline{\Xi y_4})^2 - C.F$$

$$= \frac{8^2}{4} + \frac{14^2}{4} + 0 + \frac{8^2}{4} - 56.25$$

$$SSR = 24.75$$

Step 4: Arrange treatments P, O, R, S in columnwise.

Z_1	2,	Zs	Zy			
P	Q	R	S			
1	2	3	2			
2.	4	3	5			
0	- 1	1	0			
2	1	2	3			
5	6	9	10			
	P 1 2 0	P Q 1 2 2 4 0 -1	P Q R 1 2 3 2 4 3 0 -1 1			

$$SSK = \frac{(ZZ_1)^2 + (ZZ_2)^2 + (ZZ_3)^2 + (ZZ_4)^2 - C.F}{K}$$

$$= \frac{5^2 + \frac{6^2}{4} + \frac{9^2}{4} + \frac{10^2}{4} - 56.25}{SSK = 4.25}$$

$$SSK = 4.25$$

$$SSE = SST - SSC - SSR - SSK$$

$$SSE = 4$$

Step 5: ANOVA table :

				1	1
Source	Degree of freedom	Sum of Squares	Mean Sum of Squares	Variance Yatio	Table Value
Between		SSC = 2.75	$MSC = \frac{SSC}{K-1}$. = 0.917	$F_{c} = \frac{MSC}{MSE}$ $= 1.375$	C (2.4)
Between	K-1 = 3	SSR = 24.75	$MSR = \frac{SSR}{K-1}$ $= .8.25$	$F_R = \frac{MSR}{MSE}$ $= 12.369$	F _a (3,6) = 4.76.
Between treatments		SSK = 4.25	$MSK = \frac{SSK}{K-1}$ $= 1.417$	F _K = MSK MSE	
Between	(K-1)(K-2) = $(4-1)(4-2)$ = 6	SSE = 4	$MSE = \frac{SSE}{(\kappa-1)(\kappa-2)} = 0.667$	_ = 2.124	

Step 6: Decision:

Since Fc < Fa , FK < Fa we accept the hypothesis

there is no significant difference between columns and

treatments.

Since FR > Fa, the we seject the hypothesis that there is a significant difference between 9000s.

DEPARTMENT OF MATHEMATICS

Comparison of RBD and CRD

- 1. RBD is more efficient than CRD for most types of experimental work.
- 2. In CRD, grouping of the experimental size so as to allocate the treatments at random to the experimental units is not done. But in RBD, treatments are allocated at Random within the units of each stratum.
- 3. RBD is more flexible than CRD since no sestrictions are placed on the number of treatments or the number of seplications.

Comparison of LSD and RBD

- 1. In LSD, the number of treatments is equal to the number of Aeplications whereas there is no such Aestrictions on treatments and Replications in RBD.
- 2. ISD is known to be suitable for a case when the number of treatments is between 5 and 12 since the square becomes large and does not gemain homogeneous, whereas RBD can be used for any number of treatments.
- 3. In the field layout, LSD can be performed on a square field while RBD can be performed either on a square or rectangular field.
 - 4. The main advantage of LSD is that it controls the variations between the Glows and Columns, whereas RBD controls the effect of one direction and hence the experimental error is seduced to a large extent.
