TEST OF SIGNIFICANCE FOR LARGE SAMPLES:

If the Sample Size n is greater than 30, we usually take Sample as large Sample. For large Samples, we apply normal test assuming the Population is normal.

DEPARTMENT OF MATHEMATICS

I. TESTS FOR MEANS :

(A). 1. Testing of Significance for Single mean if the population standard deviation is known.

i.e., $H_0: \mu = \mu_0$, σ is known:

Suppose we want to test whether the given sample of size n has been drawn from a population with mean μ . We set up null hypothesis that there is no difference between $\overline{\chi}$ and μ that there $\overline{\chi}$ is the sample mean. Then the test statistic will be,

$$Z = \frac{\bar{\chi} - \mu}{\sigma / \sqrt{n}}$$

where or is the S.D of the population.

A sample of 100 students is taken from a large population. The mean height of the students in this sample is 160 cm. Can it be reasonably regarded that, in the population, the mean height is 165 cm, and the S.D is 10 cm.

Solution:

Given:
$$n = 100$$

$$\overline{\chi} = 160 \text{ cm}$$

$$\mu = 165 \text{ cm}$$

$$\sigma = 10 \text{ cm}$$

Null hypothesis: H_0 : The sample is drawn from a normal population with mean $\mu = 165$ cm and $G.D.\sigma = 10$ cm.

Alternative hypothesis: H,: $\mu \neq 165$ (Two-tailed test)

Level of Significance: At & = 5 /, Zx = 1.96

Test-Statistic:

$$Z = \frac{\overline{\lambda} - \mu}{\sigma / \sqrt{n}}$$

$$= \frac{160 - 165}{10 / \sqrt{100}} = -5$$

$$\boxed{121 = 5}$$

Decision :

Since 121 > 3, Ho is rejected.

- .. The sample cannot be drawn from the normal population with mean $\mu = 165$ and SD $\sigma = 10$
- by a manufacturer is 1800 with a 5.D of 100. By a new technique in the manufacturing process, it is claimed that the breaking strength of the cable has increased. In order to test this claim, a sample of 50 cables is tested and it is found that the mean breaking strength is 1850. Can we support the claim at 5% los?

 Solution:

Given:
$$\mu = 1800$$

$$\sigma = 100$$

$$\overline{\chi} = 1850$$

$$n = 50$$

Null hypothesis: Ho: \mu = 1800

Alternative hypothesis: Ho: \ \ = 1800 (Two-tailed test)

Level of Significance: At & = 5 %,

Zx = 1.96

Test Statistic:

Decision :

Since Z > 3, Ho is sejected. The mean breating strength of the Cable has not increased.

(b) An automatic machine fills in tea in sealed tins with mean weight of tea 1 kg and 5.D 1 gm. A sandom sample of 50 tins was examined and it was found that their mean weight was 999.50 gms. Is the machine working properly?

Solution:

Given:
$$n = 50$$

$$\bar{x} = 999.50 \text{ gms}$$

$$\mu = 1000 \text{ gms}$$

$$\sigma = 1 \text{ gm}$$

Null hypothesis: Ho: The machine is working properly.
i.e., Ho: $\mu = 1000 \text{ gms}$

SNS COLLEGE OF TECHNOLOGY

(An Autonomous Institution)

Alternative hypothesis: At $\alpha = 5$ %, $Z_{\alpha} = 1.96$ H₁: $\mu \neq 1000$ gms.

Test-Statistic:

$$Z = \overline{\chi} - \mu$$

$$= 999.50 - 1000$$

$$\frac{1}{\sqrt{50}}$$

$$= -0.5 \times \sqrt{50}$$

$$= -3.54$$

$$|Z| = 3.54$$

Decision:

Since III > 3, Ho is sejected.

Therefore the machine is not working properly.

The mean life time of samples of 100 fluorescent light tubes produced by a company is computed to be 1570 hours with a SD of 120 hours. The company claims that the average life of the tubes produced by the company is 1600 hours. Using the level of Significance of 0.05 is the claim acceptable.

Solution:

E X

DEPARTMENT OF MATHEMATICS

SNS COLLEGE OF TECHNOLOGY

(An Autonomous Institution)

Given :

Null hypothesis: Ho: The claim is acceptable at 5 1/2

Los . i.e., Ho: µ = 1600

Alternative hypothesis: H,: \up + 1600 (Two-tailed test)

Level of Significance: At & = 5 1. , Zx = 1.96

Test - Statistic:

$$Z = \frac{\bar{\chi} - \mu}{s / \sqrt{n}}$$

$$z = -2.5$$

Decision:

Since 121 > Zx , Ho is rejected . Hence the

Company's claim is not acceptable at 5% Los.
