# SNS COLLEGE OF TECHNOLOGY

**(An Autonomous Institution)**

**COIMBATORE-35**

**Accredited by NBA-AICTE and Accredited by NAAC – UGC withA+ Grade Approved by AICTE, New Delhi & Affiliated to Anna University, Chennai**

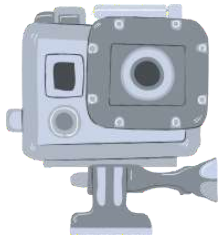
## DEPARTMENT OF EEE

## COURSE NAME: 23EET104/ ANALOG ELECTRONIC S

I YEAR / II SEMESTER

Unit 2 – Multi junction devices

Topic 1: Bipolar Junction Transistors

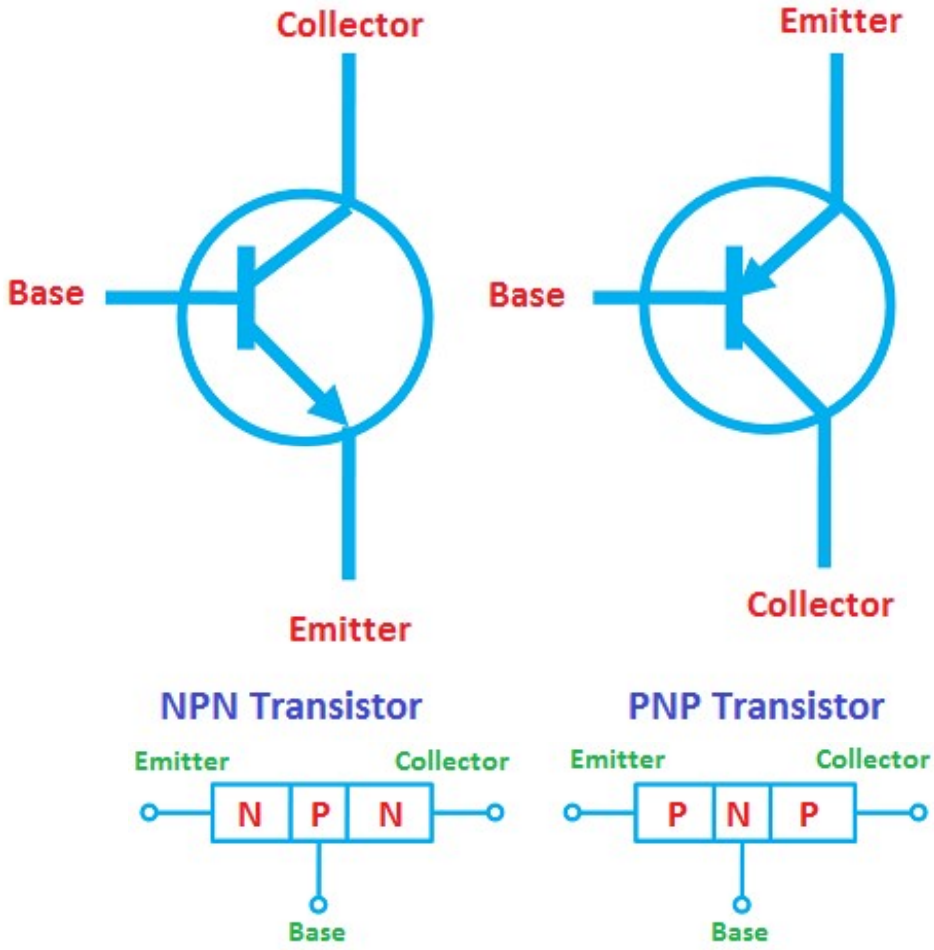


# Transistors

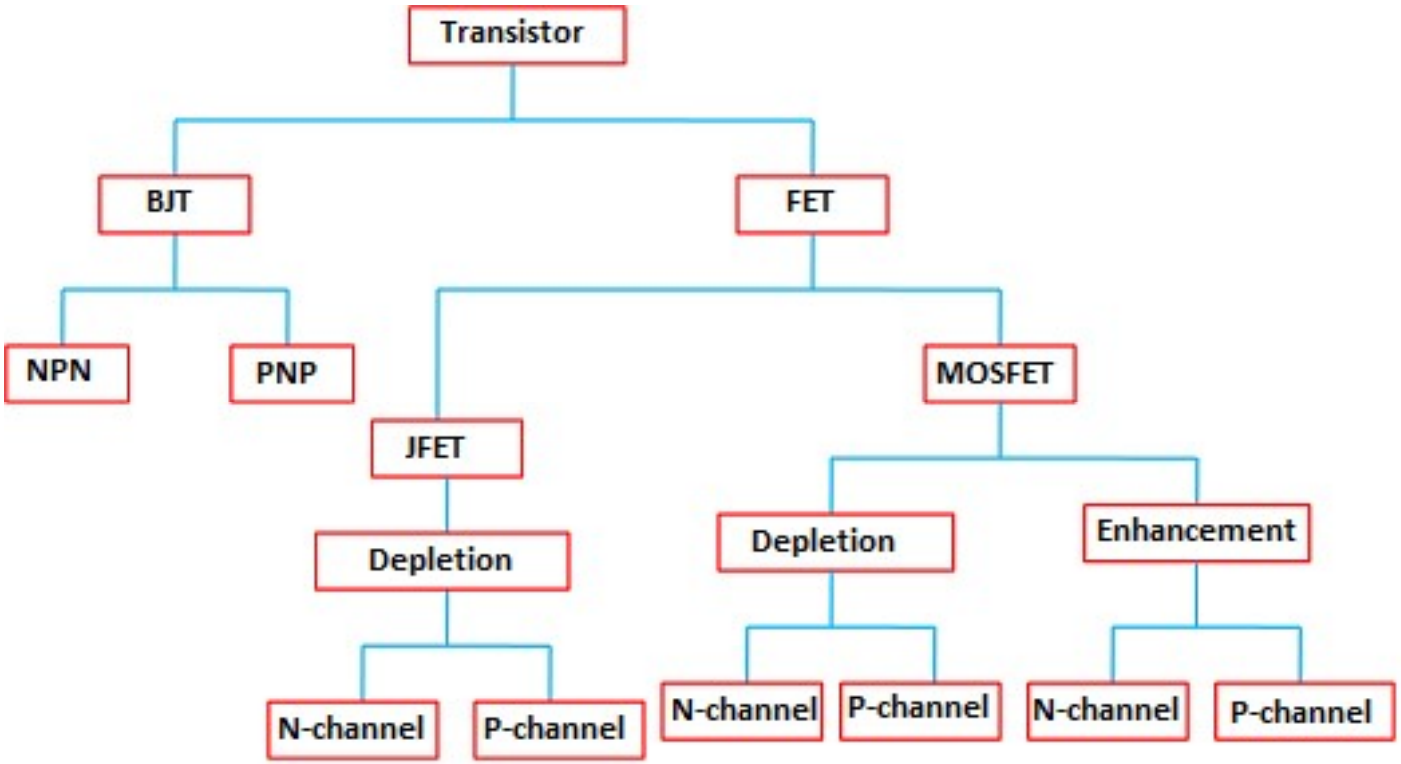
When a p-type semiconductor is joined with the n-type semiconductor, a p-n junction is formed between them. This p-n junction forms a most popular device known as a semiconductor diode.

- An addition of another layer to a p-n junction diode forms a three terminal device called a transistor that amplifies the electronic signals. The term transistor normally refers to a Bipolar Junction Transistor (BJT).
- The transistor that is made up of one p-type and two n-type semiconductor layers is known as n-p-n transistor whereas the transistor that is made up of one n-type and two p-type

# Transistors



# Classification of Transistors

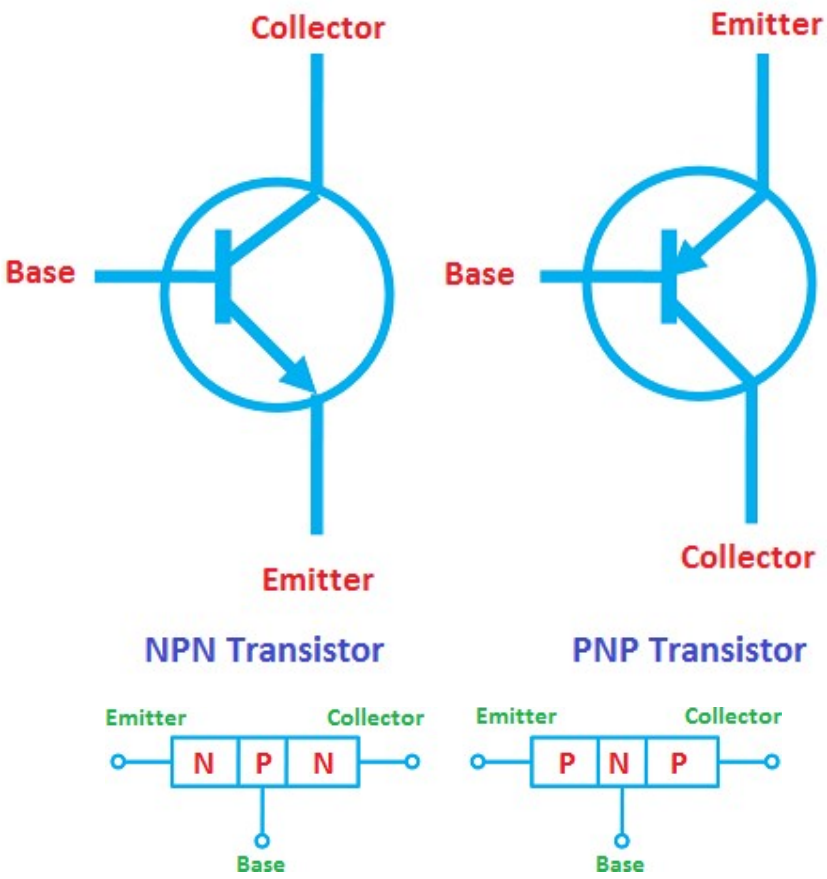


Classification of transistors

# Bipolar Junction Transistor

- A bipolar junction transistor or BJT is a three terminal electronic device that amplifies the flow of current.
- It is a current controlled device. In bipolar junction transistor, electric current is conducted by both free electrons and holes.
- Bipolar junction transistors are classified into two types based on their construction: They are
  - ✓ NPN transistor
  - ✓ PNP transistor

# Bipolar Junction Transistor



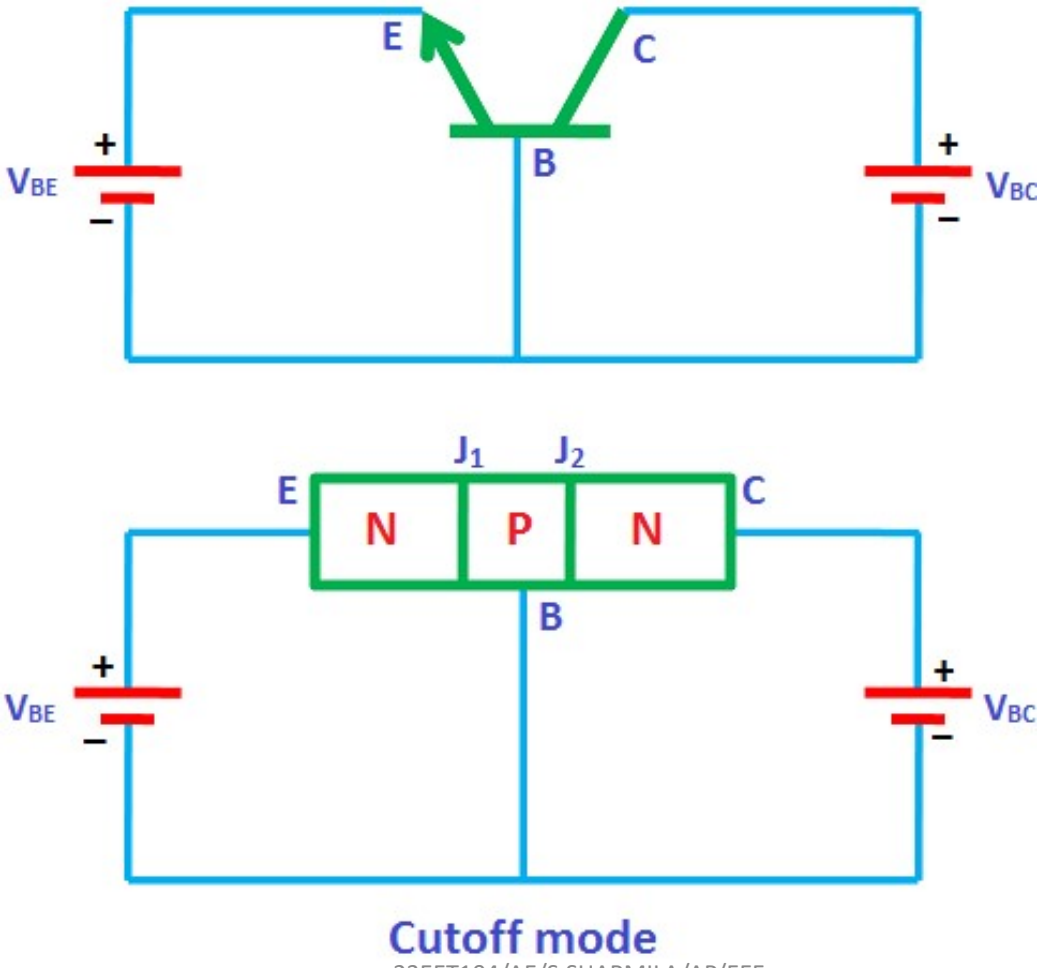
# Bipolar Junction Transistor

- **Emitter:** As the name suggests, the emitter section supplies the charge carriers. The emitter section is heavily doped so that it can inject a large number of charge carriers into the base. The size of the emitter is always greater than the base.
- **Base:** The middle layer is called base. The base of the transistor is very thin as compared to emitter and collector. It is very lightly doped.
- **Collector:** The function of the collector is to collect charge carriers. It is moderately doped. The size of the collector is always greater than emitter and base.

# BJT operation modes

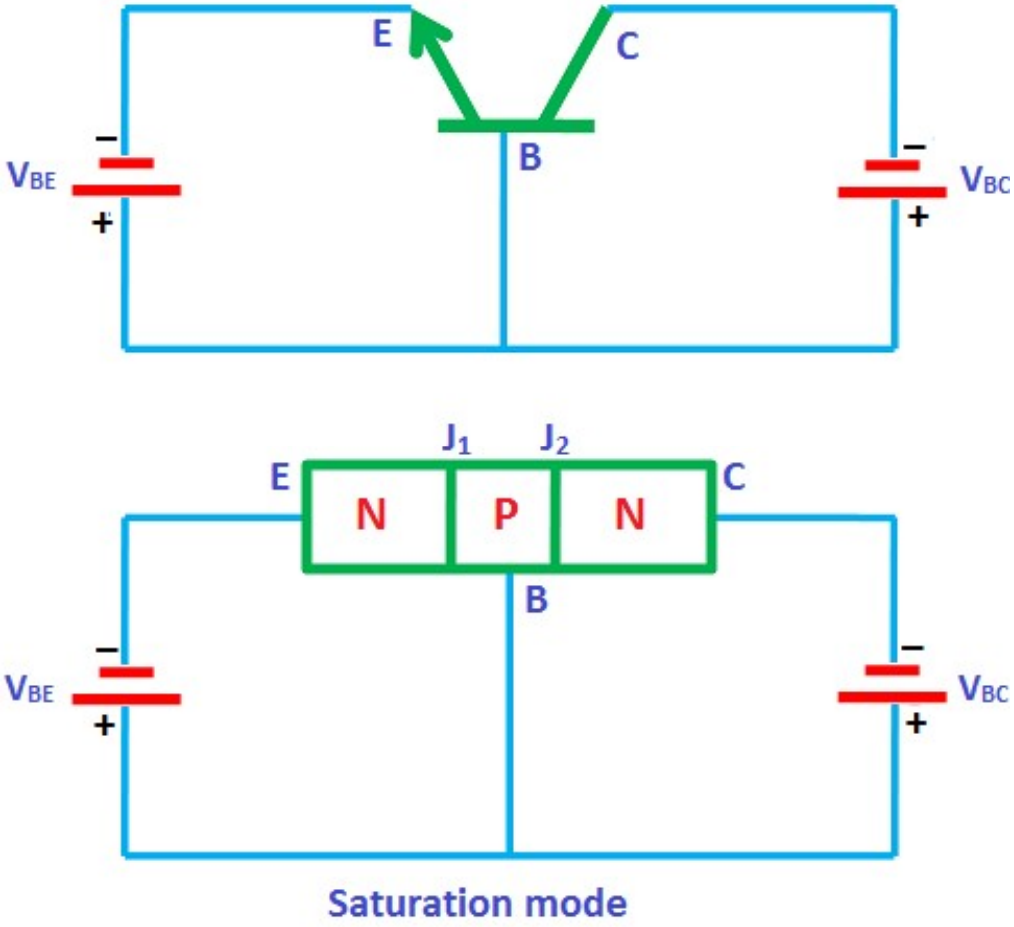
- **The transistor can be operated in three modes:**
  - ✓ **Cut-off mode**
  - ✓ **Saturation mode**
  - ✓ **Active mode**
- Applying dc voltage to the transistor is nothing but the biasing of transistor.
- In order to operate transistor in one of these regions, we have to supply dc voltage to the npn or pnp transistor.
- Based on the polarity of the applied dc voltage, the transistor operates in any one of these regions.

# Cut-off mode



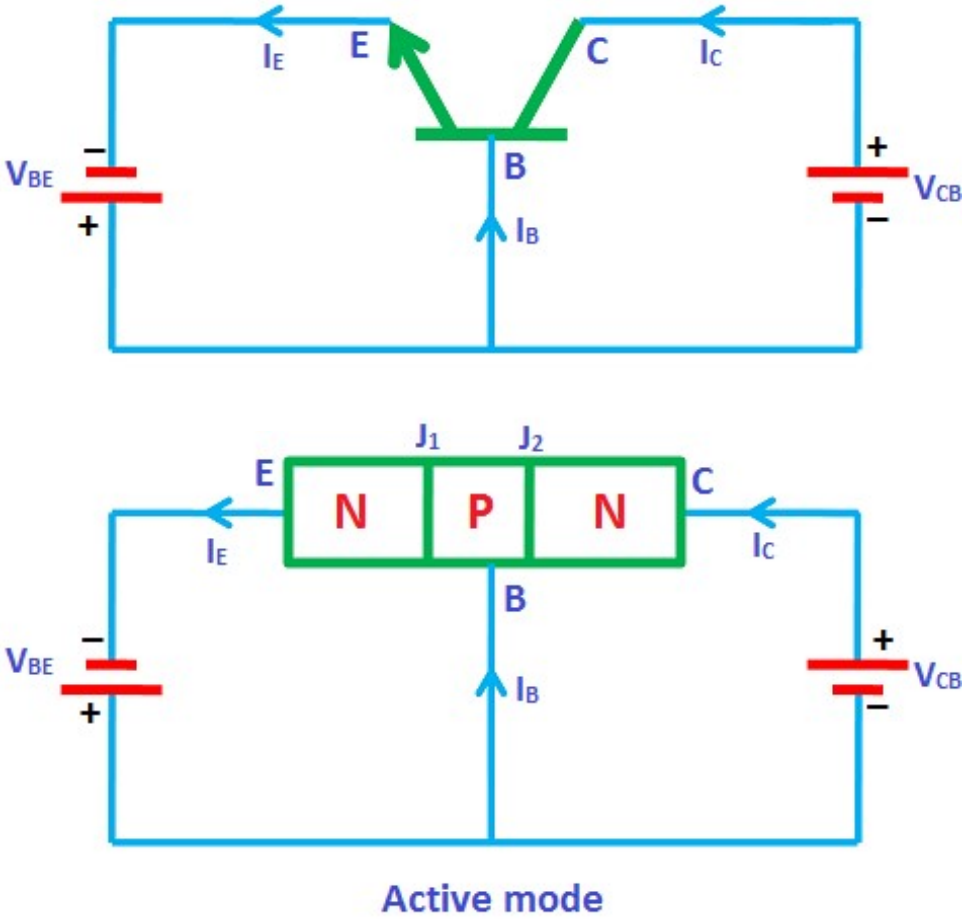
Cutoff mode

# Saturation mode



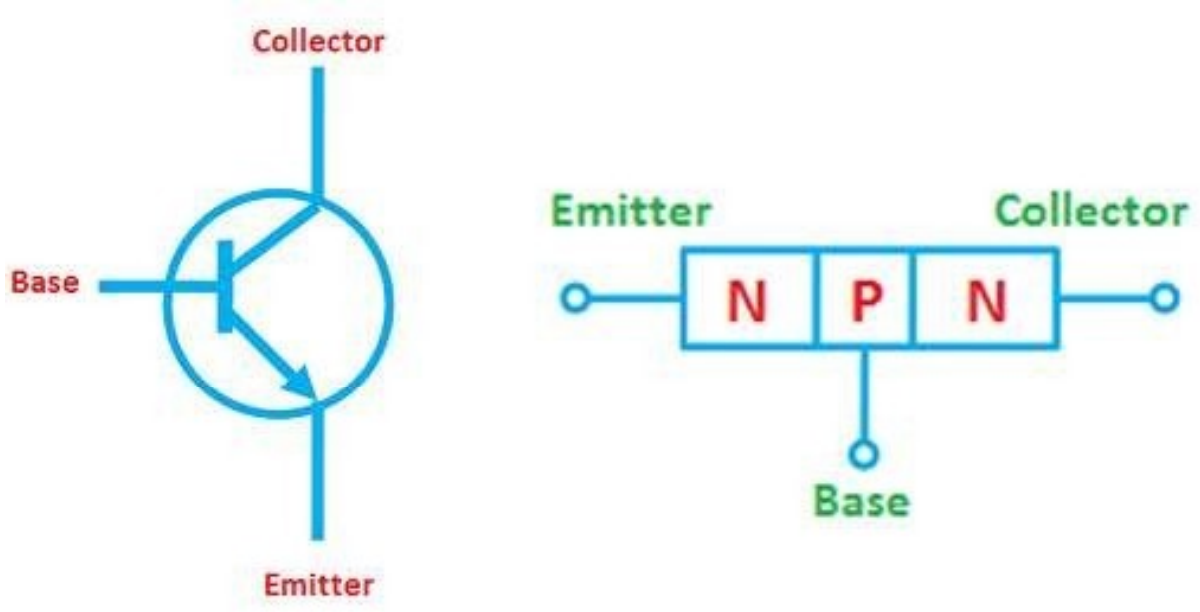
Saturation mode

# Active mode



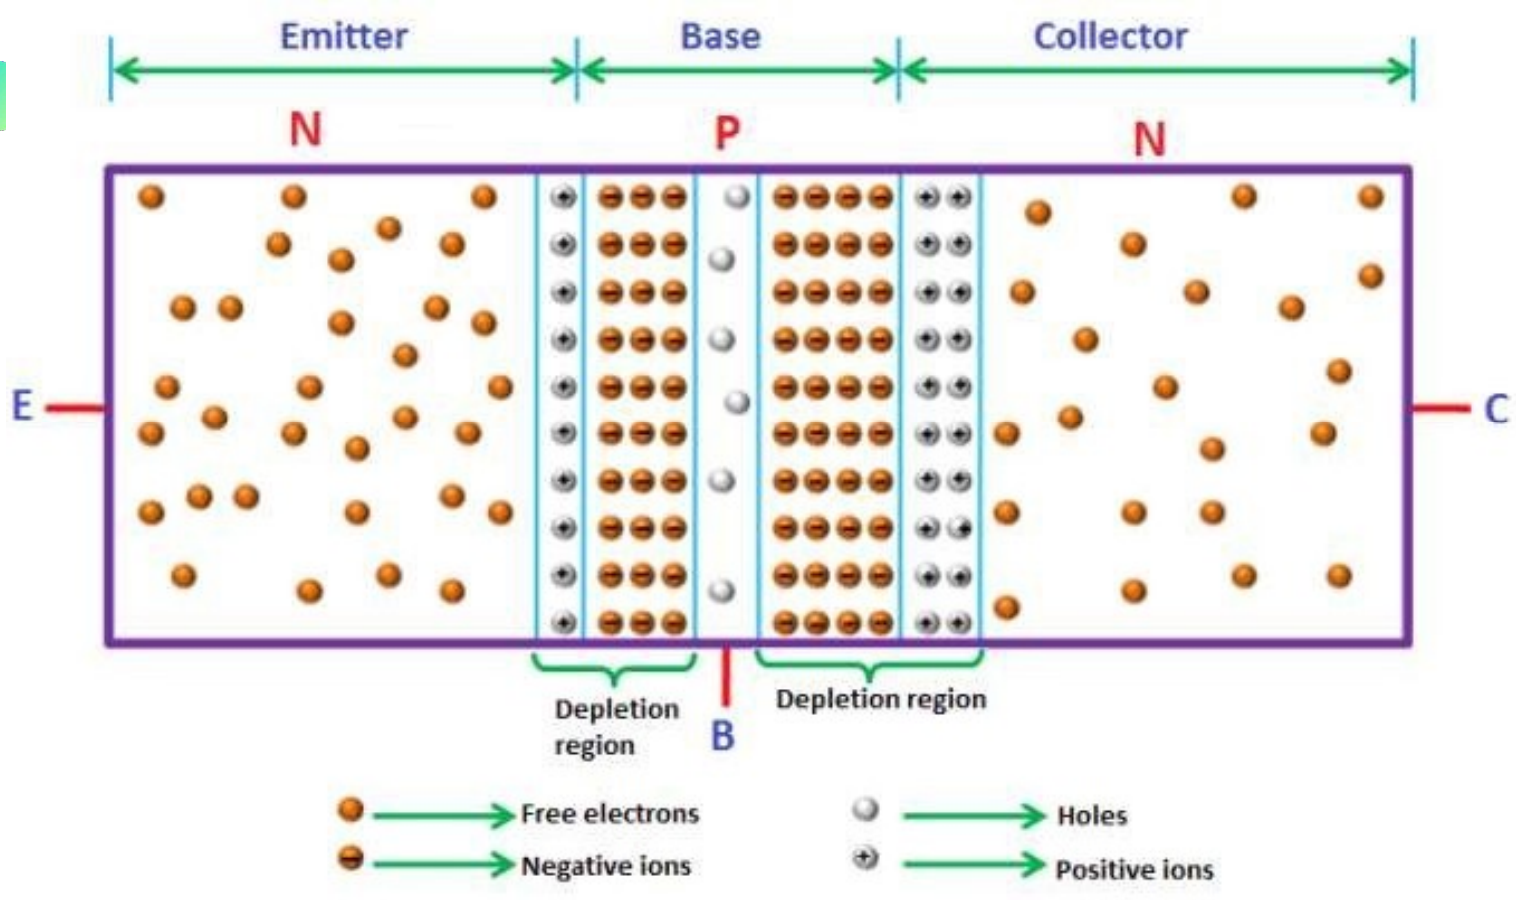
Active mode

# NPN transistor

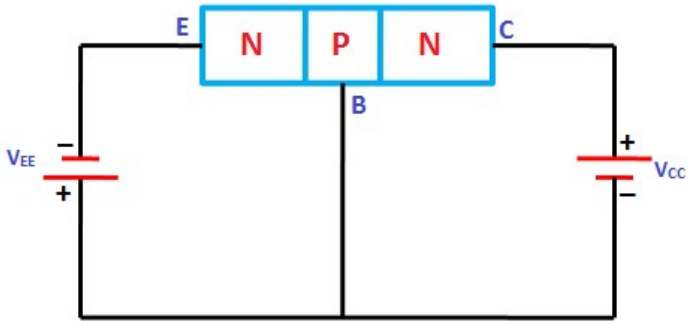


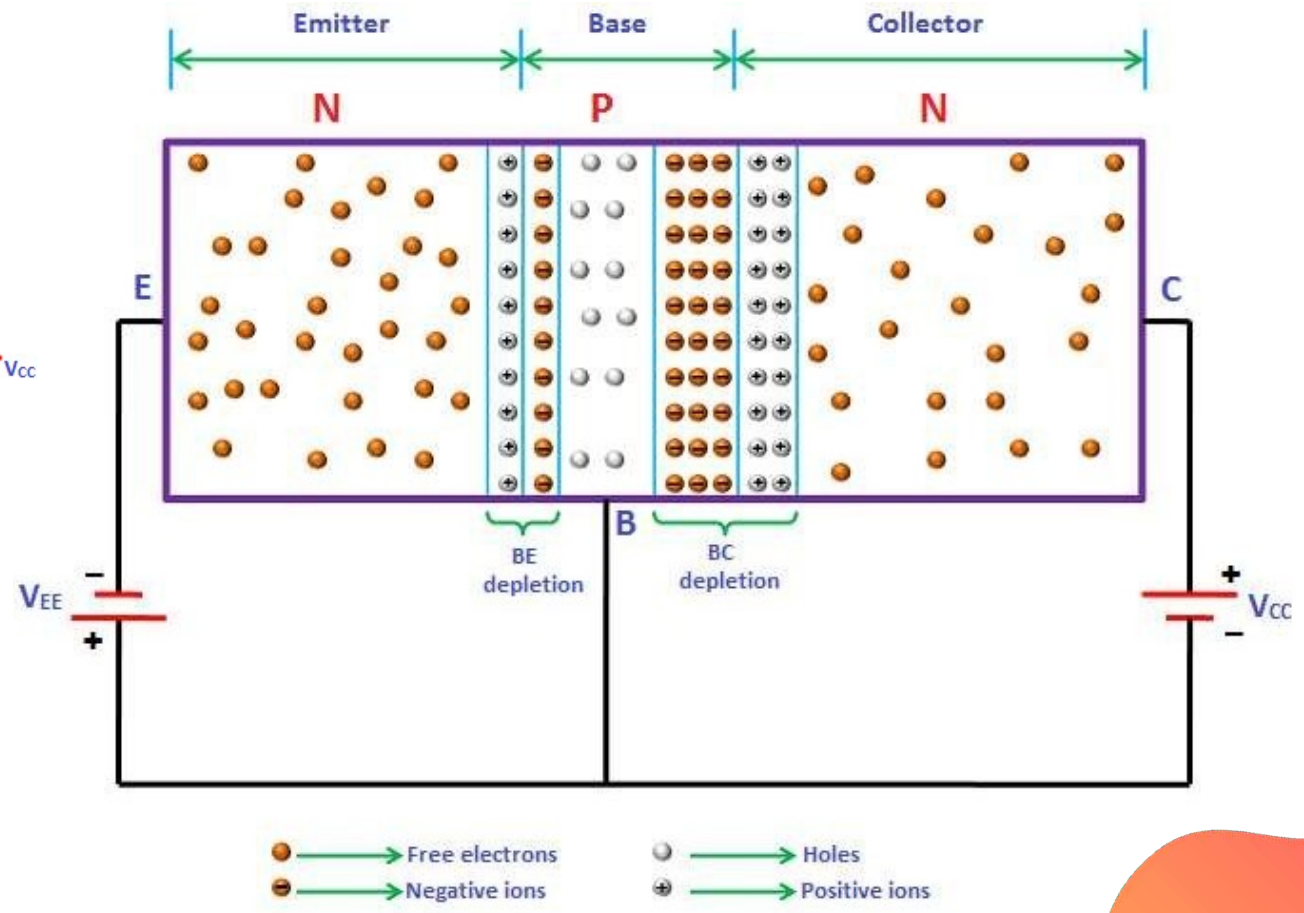
NPN transistor symbol

# Working of NPN transistor- Unbiased

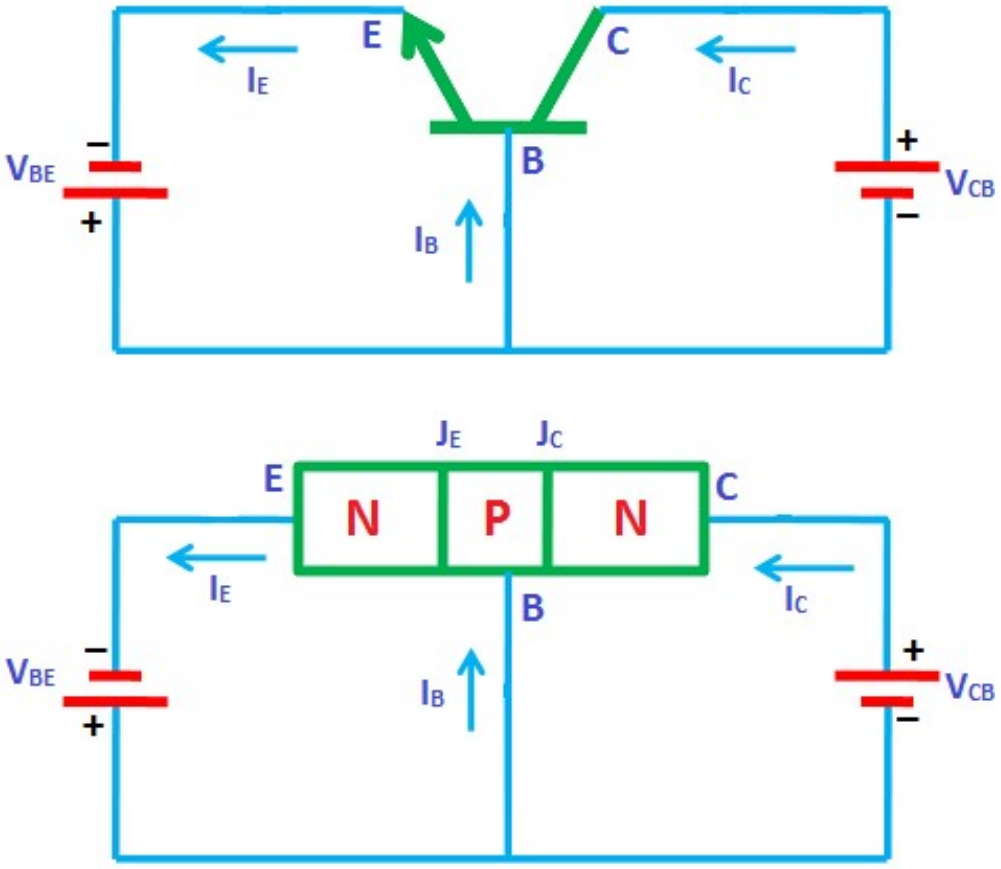


# Working of NPN transistor- Biased

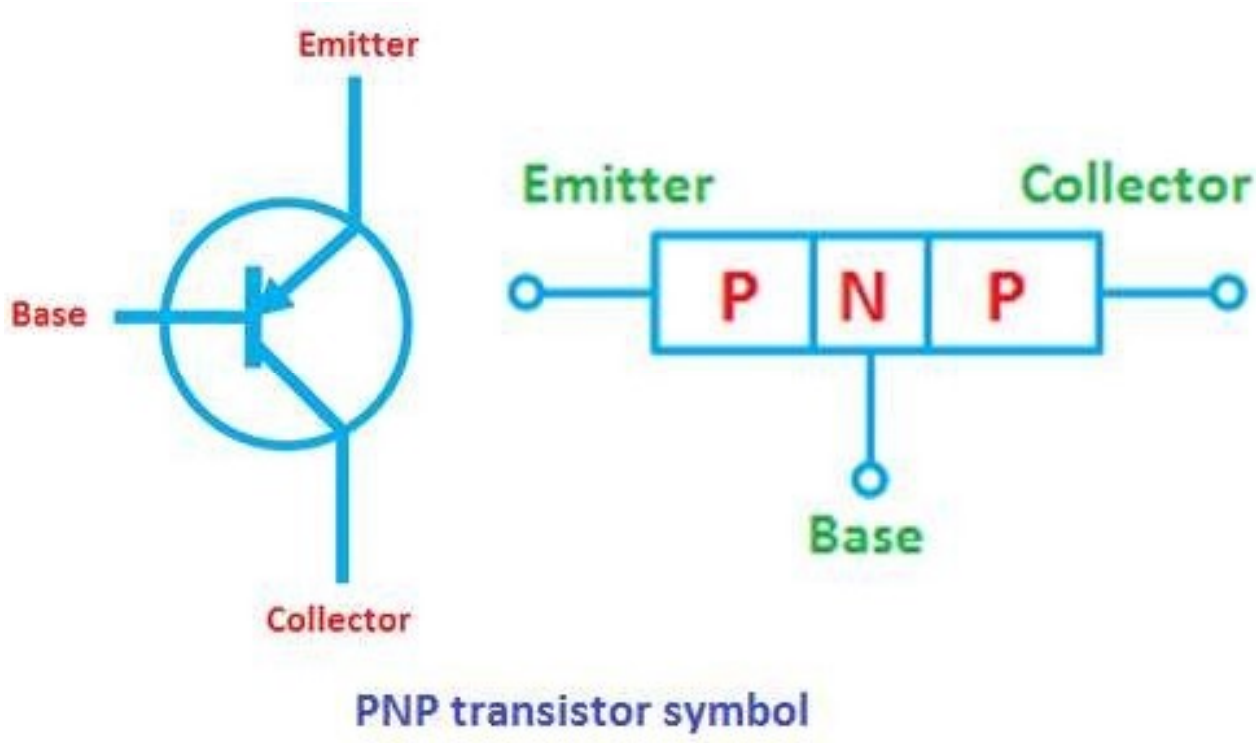




# Current direction in NPN transistor

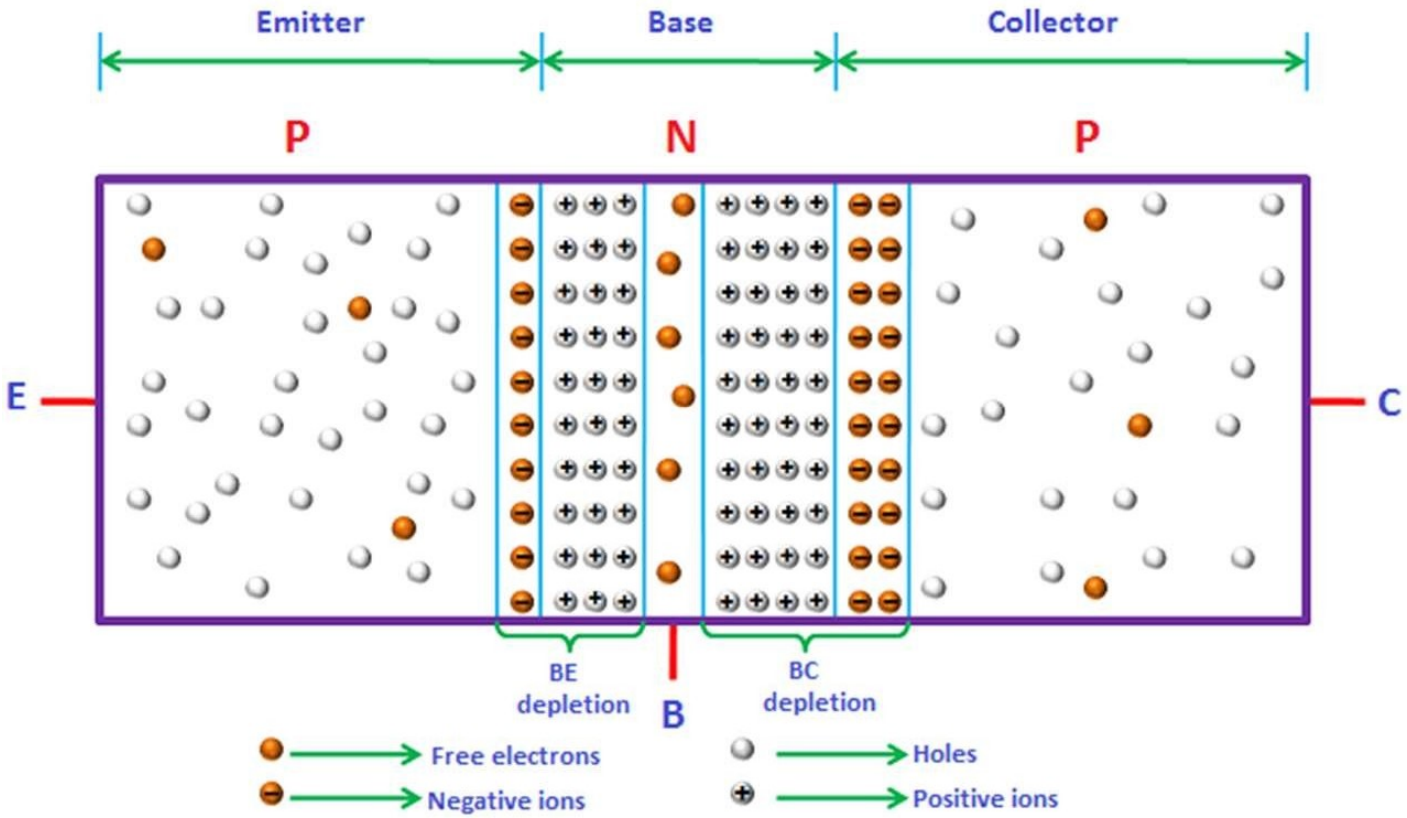


# PNP Transistor

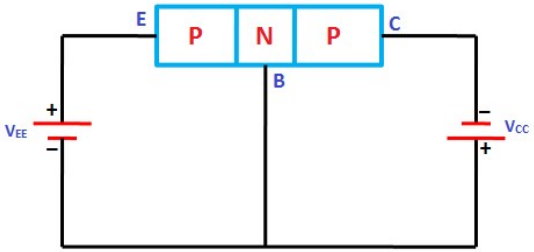


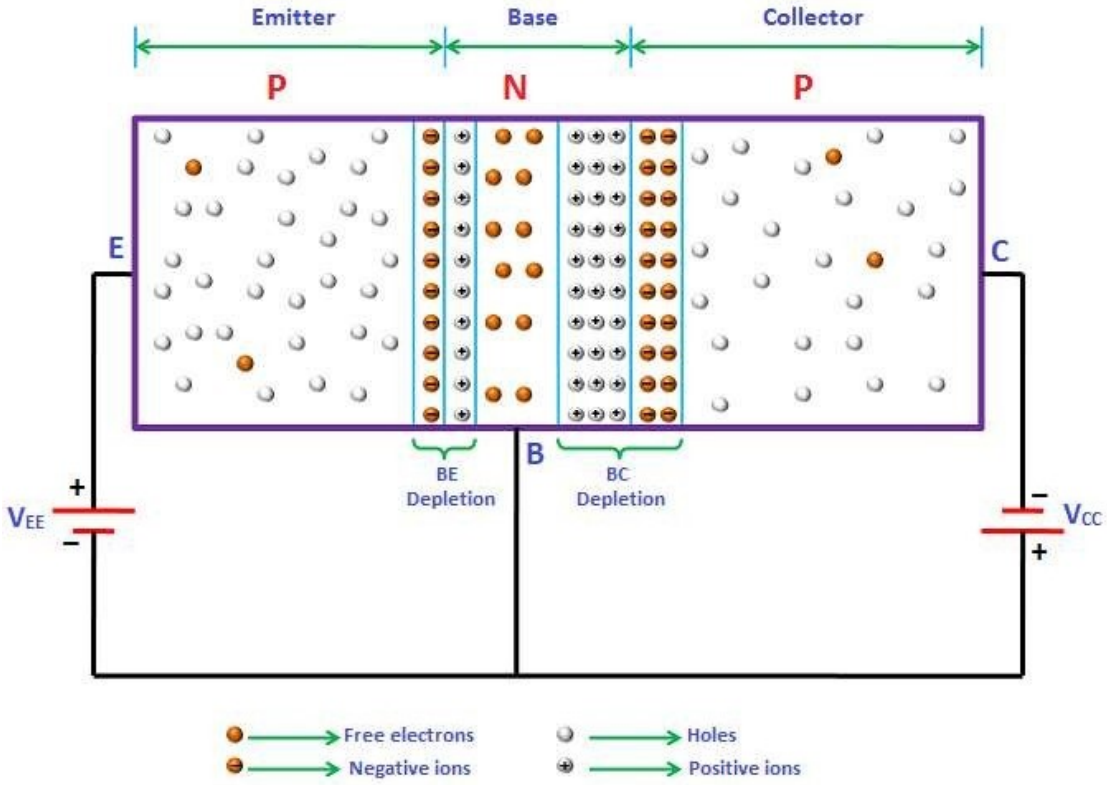
PNP transistor symbol

# Working of NPN transistor- Unbiased

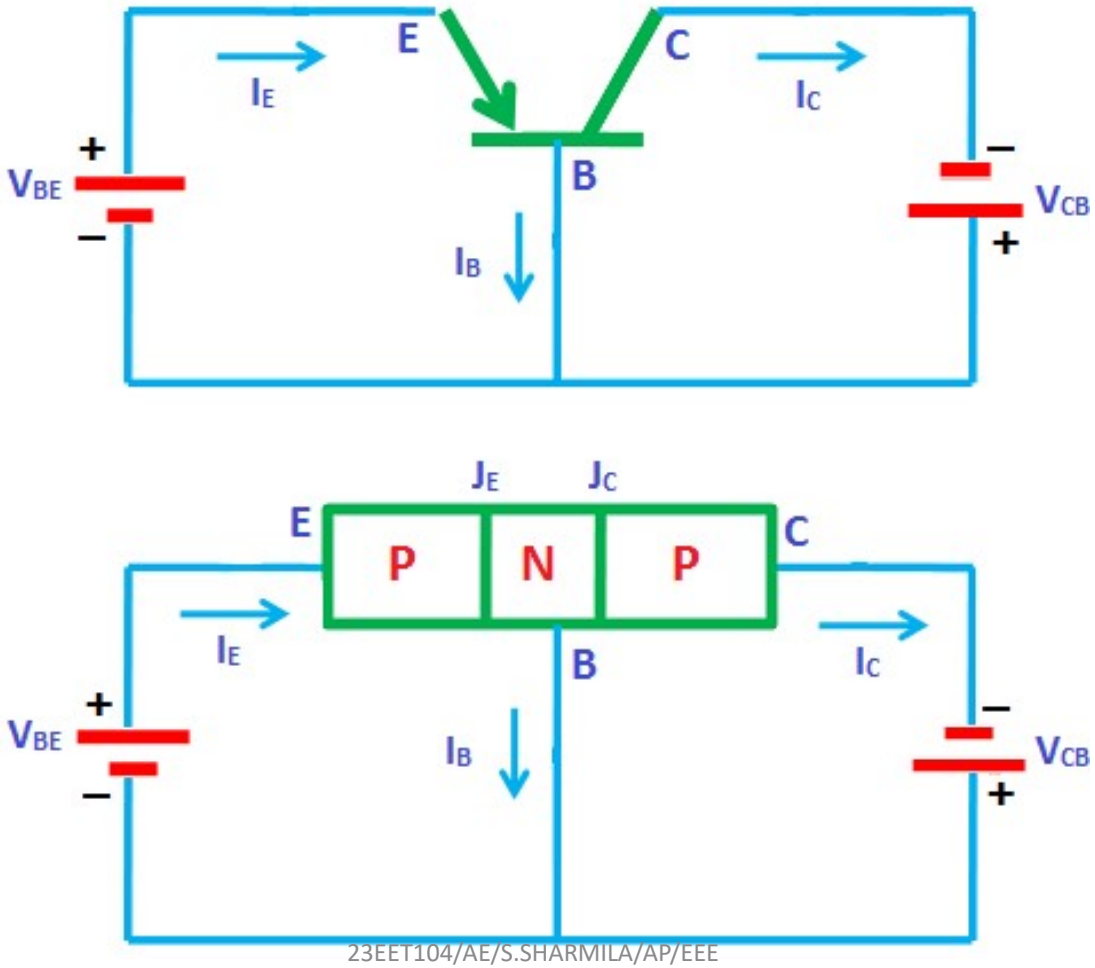


# Working of NPN transistor- Biased





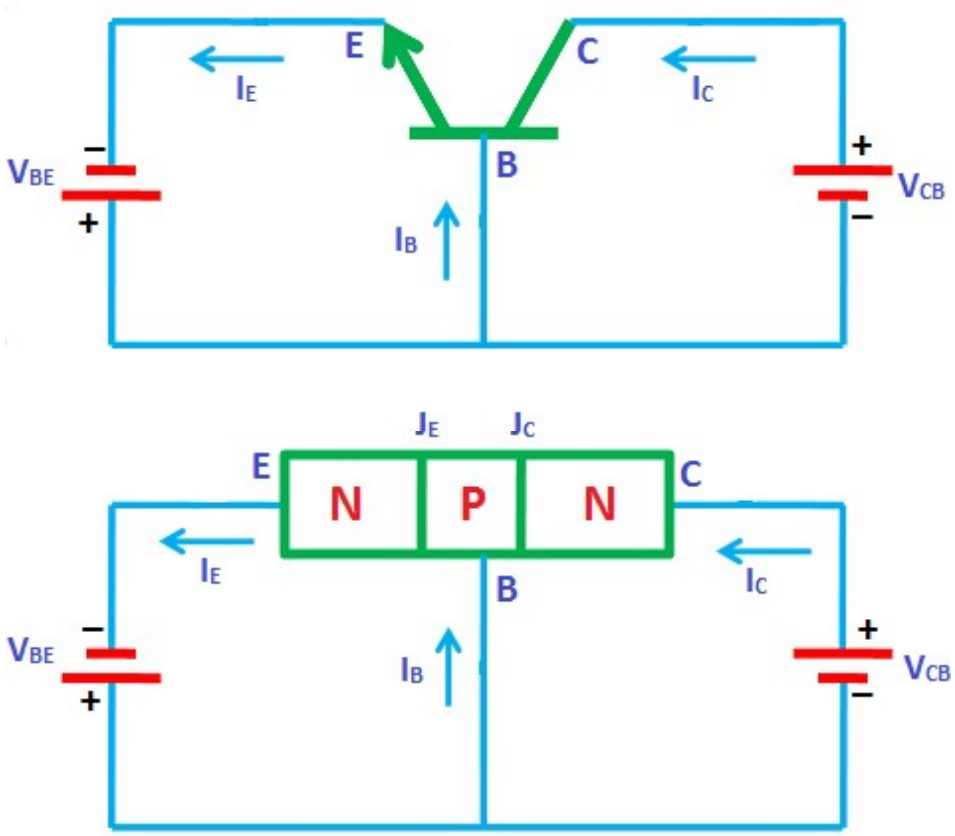
# Current direction in PNP transistor



# Types of Transistor Configuration

- We know that transistor has three terminals namely emitter (E), base (B), and collector (C). But to connect a transistor in the circuit, we need four terminals: two terminals for input and other two terminals for output.
- When a transistor is to be connected in a circuit, one terminal is used as the input terminal, the other terminal is used as the output terminal and the third terminal is common to the input and output.
- Depending upon the terminal which is used as a common terminal to the input and output terminals, the transistor can be connected in the following three configurations. They are:
  - ✓ Common base (CB) configuration
  - ✓ Common emitter (CE) configuration
  - ✓ Common collector (CC) configuration

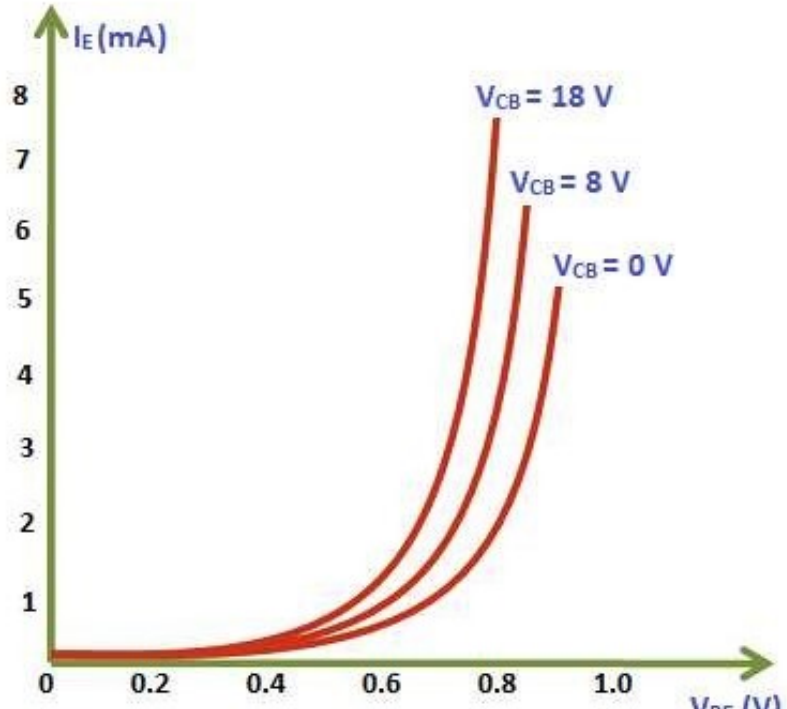
# Common base (CB) configuration



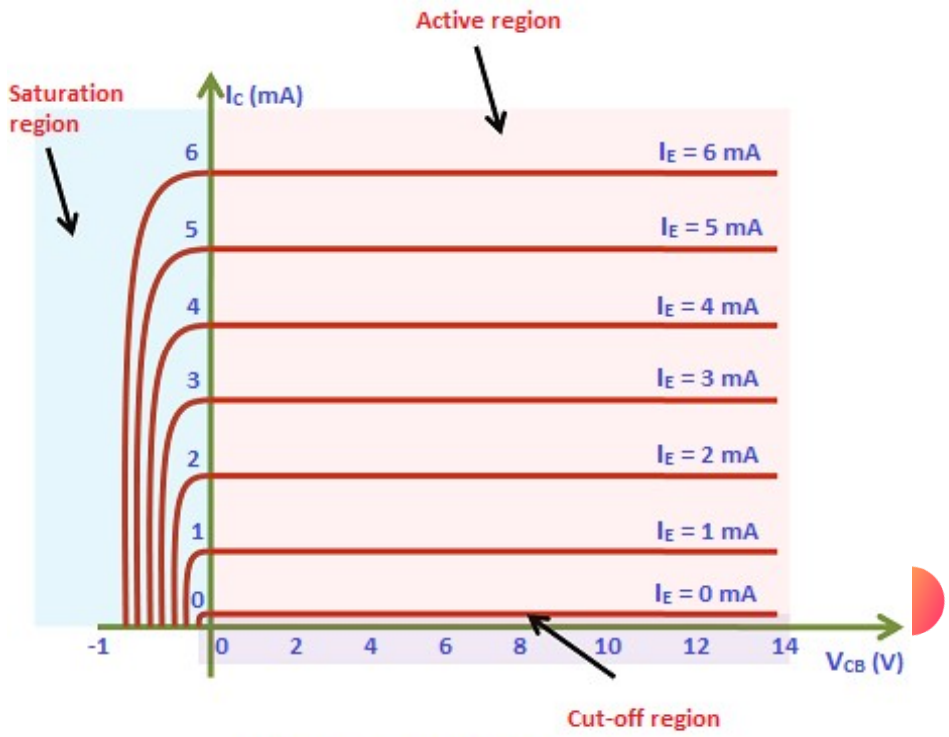
Common base configuration

$$I_E = I_B + I_C$$

# Transistor Characteristics



I/p characteristics CB configuration



O/P characteristics CB configuration

# Transistor Parameters

| Dynamic input resistance ($r_i$) | Dynamic output resistance ($r_o$) | Current gain (α) |
|---|---|---|
| Dynamic input resistance is defined as the ratio of change in input voltage or emitter voltage ($V_{BE}$) to the corresponding change in input current or emitter current ($I_E$), with the output voltage or collector voltage ($V_{CB}$) kept at constant.<br>$r_i = \frac{\Delta V_{BE}}{\Delta I_E}$,<br>$V_{CB} = Constant$ | Dynamic output resistance is defined as the ratio of change in output voltage or collector voltage ($V_{CB}$) to the corresponding change in output current or collector current ($I_C$), with the input current or emitter current ($I_E$) kept at constant.<br>$r_o = \frac{\Delta V_{CB}}{\Delta I_C}$,<br>$I_E = Constant$ | The current gain of a transistor in CB configuration is defined as the ratio of output current or collector current ($I_C$) to the input current or emitter current ($I_E$).<br>$\alpha = \frac{I_C}{I_E}$ |
