

Definition:-

The Laplace transform of a function $f(t)$ defined for $0 \leq t < \infty$ is denoted by $L[f(t)]$.

$$(i.e) L[f(t)] = \int_0^{\infty} e^{-st} f(t) dt$$

Formulas:-

$$L[1] = 1/s$$

$$L[e^{at}] = \frac{1}{s-a}$$

$$L[e^{-at}] = \frac{1}{s+a}$$

$$L[\sin at] = \frac{a}{s^2+a^2}$$

$$L[\cos at] = \frac{s}{s^2+a^2}$$

$$L[t] = \frac{1}{s^2}$$

Properties of Laplace transforms:-

i) $L[e^{at} f(t)] = [L[f(t)]]_s \rightarrow s-a$

[If the function is multiplied with e]

ii) $L[tf(t)] = -\frac{d}{ds} L[f(t)]$

[If the function is multiplied with t]

$$L[t^2 f(t)] = \frac{d^2}{ds^2} L[f(t)]$$

In general $L[t^n f(t)] = (-1)^n \frac{d^n}{ds^n} L[f(t)]$

iii) $L\left[\frac{f(t)}{t}\right] = \int_s^{\infty} L[f(t)] ds$

[If the function is divisible with t]

Problems:-

1. Find the Laplace transforms of $e^{-at} \cos 3t$

Soln:- $L[e^{-at} \cos 3t]$
 By the property: $L[e^{at} f(t)] = [L[f(t)]]_{s \rightarrow s-a}$
 $= [L[\cos 3t]]_{s \rightarrow s+2}$
 By the formula $L[\cos at] = \frac{s}{s^2+a^2}$
 $\therefore [L[\cos 3t]]_{s \rightarrow s+2} = \left[\frac{s}{s^2+9} \right]_{s \rightarrow s+2}$
 $= \frac{s+2}{(s+2)^2+9}$
 $= \frac{s+2}{s^2+4+4s+9}$
 $= \frac{s+2}{s^2+4s+13}$ "

2) find the laplace transform of $t \sin at$.
Soln:- $L[t \sin at]$
 By the property: $L[tf(t)] = -\frac{d}{ds} L[f(t)]$
 $= -\frac{d}{ds} L[\sin at]$
 $= -\frac{d}{ds} \left[\frac{a}{s^2+4} \right] \frac{u}{v}$ $L[\sin at] = \frac{a}{s^2+a^2}$
 $= - \left[\frac{(s^2+4) \cdot 0 - a \cdot (2s)}{(s^2+4)^2} \right]$
 $= \frac{+4s}{(s^2+4)^2}$ "

3) find the laplace transform of $\frac{1-e^{-t}}{t}$

Soln:- $\mathcal{L} \left[\frac{1-e^{-t}}{t} \right]$

By the property: $\mathcal{L} \left[\frac{f(t)}{t} \right] = \int_s^\infty \mathcal{L} [f(t)] ds$

$$= \int_s^\infty \mathcal{L} [1-e^{-t}] ds$$

$$= \int_s^\infty \left[\frac{1}{s} - \frac{1}{s+1} \right] ds$$

$$= \left[\log s - \log (s+1) \right]_s^\infty = \left[\log \frac{s}{s+1} \right]_s^\infty$$

$$= \left[\log \frac{s}{s(1+1/s)} \right]_s^\infty = \left[\log \frac{1}{1+1/s} \right]_s^\infty$$

$$= \log 1 - \log \frac{1}{1+s}$$

$$= 0 - \log \left(\frac{s}{s+1} \right)$$

$$= \log \left(\frac{s+1}{s} \right) "$$

4) Find the Laplace transform of $t e^{-3t} \cos at$

Soln:- $\mathcal{L} [t e^{-3t} \cos at] = \mathcal{L} [e^{-3t} t \cos at]$

By the 1st property $\Rightarrow [\mathcal{L} [t \cos at]]_{s \rightarrow s+3} \rightarrow \textcircled{1}$

$\mathcal{L} [t \cos at] = -\frac{d}{ds} \mathcal{L} [\cos at]$ [By 2nd property]

$$= -\frac{d}{ds} \left[\frac{s}{s^2+4} \right]$$

$$= - \left[\frac{(s^2+4)(1-s(2s))}{(s^2+4)^2} \right]$$

$$\begin{aligned} &= - \left[\frac{-s^2 + 4}{(s^2 + 4)^2} \right] \\ &= \frac{s^2 - 4}{(s^2 + 4)^2} \\ &\quad \text{sub in } \textcircled{1} \\ \mathcal{L} [t e^{-3t} \cos 2t] &= \left[\frac{s^2 - 4}{(s^2 + 4)^2} \right]_{s \rightarrow s+3} \\ &= \frac{(s+3)^2 - 4}{[(s+3)^2 + 4]^2} \\ &= \frac{s^2 + 9 + 6s - 4}{(s^2 + 9 + 6s + 4)^2} \\ &= \frac{s^2 + 6s + 5}{(s^2 + 6s + 13)^2} \end{aligned}$$
