Laplace transforms:-

$f(t)$ be the function of 't' defined for $t > 0$, then the laplace transform of $f(t)$ defined by.

$$[f(t)] = \int_0^{\infty} e^{-st} f(t) dt = F(s)$$

condition for existence of laplace transforms:-

1st condition : $f(t)$ should be continuous or continuous in the closed integral [a,b].

→ $f(t)$ should be exponential of order that ψ_s i.e., $\lim_{s \rightarrow \infty} e^{-st} f(t) = 0$

Inverse Laplace transforms:-

If laplace transforms of $f(t)$ is $F(s)$ i.e., $L[f(t)] = F(s)$, then $f(t)$ is called the inverse laplace transforms of $F(s)$ and is written by

$$[f(t)] = L^{-1}[F(s)]$$

Laplace formula table:-

$$L[f(t)] = F(s)$$

$$L[1] = 1/s$$

$$L[t] = 1/s^2$$

$$L[t^n] = \frac{n!}{s^{n+1}}$$

$$L[e^{at}] = \frac{1}{s-a}$$

$$L[e^{-at}] = \frac{1}{s+a}$$

$$L[s \sin at] = \frac{a}{s^2 + a^2}$$

$$L^{-1}[F(s)] = f(t)$$

$$L^{-1}[1/s] = 1$$

$$L^{-1}[1/s^2] = t$$

$$L^{-1}\left[\frac{n!}{s^{n+1}}\right] = t^n$$

$$L^{-1}\left[\frac{1}{s-a}\right] = e^{at}$$

$$L^{-1}\left[\frac{1}{s+a}\right] = e^{-at}$$

$$L^{-1}\left[\frac{a}{s^2 + a^2}\right] = s \sin at$$

UNIT-V LAPLACE TRANSFORMS

Inverse Laplace transform -partial fraction

$$L \left[\frac{\sin at}{a} \right] = \frac{1}{s^2 + a^2}$$

$$L \left[\cos at \right] = \frac{s}{s^2 + a^2}$$

$$L [k] = \frac{k}{s}$$

$$L^{-1} \left[\frac{1}{s^2 + a^2} \right] = \frac{\sin at}{a}$$

$$L^{-1} \left[\frac{s}{s^2 + a^2} \right] = \cos at$$

Partial fraction:

i) Find $L^{-1} \left[\frac{1}{s(s+1)(s+2)} \right]$

By PF,

$$\frac{1}{s(s+1)(s+2)} = \frac{A}{s} + \frac{B}{s+1} + \frac{C}{s+2} \rightarrow (1)$$

$$\frac{1}{s(s+1)(s+2)} = \frac{A(s+1)(s+2) + B(s+1)(s+2) + C s(s+1)}{s(s+1)(s+2)}$$

$$1 = A(s+1)(s+2) + B s(s+2) + C s(s+1)$$

Put $s=0$,

$$1 = A(0)(2) + 0 + 0 \\ 2A = 1 \Rightarrow A = 1/2$$

Put $s=-1$

$$1 = 0 + B(-1)(-1+2) + 0 \\ 1 = -B \Rightarrow B = -1$$

Put $s=-2$

$$1 = 0 + 0 + C(-2)(-2+1)$$

$$1 = 2C \Rightarrow C = 1/2$$

$$(1) \Rightarrow \frac{1}{s(s+1)(s+2)} = \frac{1/2}{s} - \frac{1}{s+1} + \frac{1/2}{s+2}$$

$$L^{-1} \left[\frac{1}{s(s+1)(s+2)} \right] = 1/2 L^{-1} \left[\frac{1}{s} \right] - L^{-1} \left[\frac{1}{s+1} \right] + 1/2 L^{-1} \left[\frac{1}{s+2} \right]$$

UNIT-V LAPLACE TRANSFORMS

Inverse Laplace transform -partial fraction

$$= \frac{1}{2}(1) - e^{-t} + \frac{1}{2} e^{-2t}$$

Find $L^{-1} \left[\frac{s^2}{(s+1)(s^2+4)} \right]$

By PF,

$$\frac{s^2}{(s+1)(s^2+4)} = \frac{n}{s+1} + \frac{Bs+C}{s^2+4} \rightarrow (1)$$

$$= \frac{A(s^2+4) + (Bs+C)(s+1)}{(s+1)(s^2+4)}$$

$$s^2 = A(s^2+4) + (Bs+C)(s+1)$$

put $s = -1$

$$(-1)^2 = A((-1)^2+4) + 0$$

$$1 = 5A \Rightarrow A = 1/5$$

put $s = 0$

$$0 = A(0+4) + (0+C)(0+1)$$

$$0 = 4A + C$$

$$4(1/5) + C = 0$$

$$\boxed{C = -4/5}$$

equating the coefficient of s^2 in.

$$s^2 = As^2 + 4A + Bs^2 + Bs + Cs + C$$

$$1 = A + B$$

$$B = 1 - 1/5 = 4/5$$

(1) $\Rightarrow \frac{s^2}{(s+1)(s^2+4)} = \frac{1}{5} + \frac{\frac{4}{5}s - \frac{4}{5}}{s^2+4}$

$$L^{-1} \left[\frac{s^2}{(s+1)(s^2+4)} \right] = \frac{1}{5} L^{-1} \left[\frac{1}{s+1} \right] + \frac{4}{5} L^{-1} \left[\frac{s}{s^2+2^2} \right] - \frac{4/5}{s^2+2^2}$$
